Well, it's time to redesign it ;-)

US$ 39.95 +++ for a kit/device with "a lack of filtering" ?? No, tnx !!

To build your own (de-)scrambler, just for a couple of bucks:

Source record: 161453

A Pro 2005 base set, 400 channels, good shape, full capabilities, only problem is the back light is very dim. I don't use it any more, I've got enough radios already so $250 or best offer takes it. low ball offers will be ignored, if you know what this is you know what it's worth. I also have a friends pro 60 now, he'd like $150 and its in good shape.
I would prefer a local sale to avoid all the hassles of shipping and so you'll actually see before you buy
The Pro 43 is sold,thanks.

I too live in Ontario...I dont think the name is Copyrighted :)

As for material , I obtained mine from MANY sites...spent countless hrs...the site you seem to think was robbed from you , in fact has been in the works for 6 Months now.,..I have never heard of you b4....however..I did get to your site 2 weeks ago...I emailed you....and you didnt reply....Your FRQ about Sudbury are WAY out of whack my good man....your Missing 4 FRQ's and how about some info on the 800 Mhz system in Sudbury...you didnt reply...you did nothing...I wont FLAME in here.,...you have my email addey , and I wont flame in ANY NS much less this one....I also didnt see a file section...you link to everyone else... ???..The FRQ info I got from your site is a follows

the 900 Mhz phones....sorry but thats it....the rest I got from many sources... :)

So pls dont flatter yourself too much....Ohh and ONTSAN means (if you read the site) means Ontario Scanner Association......A link Into The North...

So pls tell your ever so sad story somewhere else :)

Have a good Day!

What web site....Xoom is free to anyone...as for my Geo account , I have no POP3 mail...hate those pesky web based mailers...

Why you hate to pay for web space ? lemme clue ya in Ron...

There is MEGA MEGS of FREE spcace out there....even VIR DOMAIN NANMES free....drop me a line and Ill point you in the right direction :)

> How sad.

Yes it is...when you havent the 1st clue about me & the site....you FLAME right off the bat...if you know my email addey , I am sure many users of this NS can attest to the fact I reply to all email quickly!...I would have no war

with you...email me...keep it out of here...This is a NS group...not a FLAME group.. :)

Sorry ppl of this NS to blow a little steam off...Now back to scanning!

Greetings,

I have a Yaesu FTC-1123 VHF handie-talkie with no manual. I know about the program switch on the bottom of the radio, but can't make any sense on how to program the radio from there.

If anyone can give me directions on how to program this radio, I would greatly appreciate it.

Or if you have a copy of a manual you could send me, I would be glad to pay for copies and postage!

You should go here and get this version:
http://www.geocities.com/SiliconValley/Lab/1067/

and make sure your comport is set right with a command like:
/COM:1 - selects Com1 for input from data slicer (default)

Some scanner and radio connections need this:
/RE - reverses input polarity

mdtw1234 /RE /COM:1

Works under windows95 for me.

I just felt there was no need to respond in such a rude and crude manner. If a person has no interest in a topic, don't read it. And as you say, there is freedom of expression, which is what the folks in the previous posts were doing. He was trying to inhibit their "conversation".

I just wonder if his mama know how he "talks"? I feel sure she would be very ashamed of him.

Thank you for your positive comment re: my previous posts. I am new to scanning and have learned losts from the newgroups and SCAN-L.

I have a Uniden BC895XLT and I am looking for a good indoor antenna that will give me a greater range than the telescopic antenna included with the unit. The manual mentions something regarding wide-band antennas, and when I contacted Uniden support, they said that they only had base antennas in stock.

Does anyone know of a good source to acquire an indoor, long range antenna, if one exists?

Any help would be greatly appreciated.

That's true. Fortunately I live in an area that's very sparsely
populated, so we can get away with that kind of thing. Since CATV
QRM is such a problem in so many areas, I'd like to the see the
bandplan changed to allow the input/output freq chosen at the
descretion of the local coordinator - like they do on 440. As
long as there won't be two repeaters back-to-back locking each
other up, I see no reason to disallow 144.xxx +600 repeaters.

> What happened here was that a couple of hams contacted the local cable
> company and got them to offset the 145.25 carrier enough to get it out
> of the passband of ham receivers. This solved the problem locally,
> but some folks in outlying areas still had problems with other cable
> suppliers in smaller towns.

I've seen 145.250 carriers that are AWFULLY wideband and dirty.
I'm surprised that a small frequency shift was able to solve the
problem - but I'm glad you guys were able to work it out. For the
most part, the entire 145 MHz segment can be wiped out in some
areas - not by the carrier, specifically, but by the buzzing, etc.
that seems to peak around that area. That's why allowing 144.xxx
+600 would be a real help. Get the receivers farther away from all
the crud.

Plus the customers complaining about the video interference all the
time adds incentive to CATV to keep the leakage down.

The old 152 MHz phone band is still VERY popular around here. It's
used as point-to-point phone links to the tourist, logging and
mining camps that are well away from town. Bell's tower site
is right in town, and channel 19 on cable is a complete write-off
in the evenings due to their sigs leaking INTO the CATV line.

Most of these devices are "line carrier" devices. They don't use an RF freq, rather they encode the information as a carrier on the House AC wires. You plug in the IR Receiver in the room you want to control from, plug in the IR Transmitter in the room you want to control equipment in. The receivers sees an IR signal, modulates it onto the house wiring, the transmitter receives it (usually, there are some stipulations) and tranmits the IR signal to the equipment being controlled.

Much like X-10 (in fact, manufactured by the same people) but that's another story for another day.

Complete and in box. See link below for picture.

The Bearcat BC 3000 XLT Scanner Radio is a 400 channel hand-held receiver. Coverage is from 25 MHz to 1.3 GHz (less 550 MHz and 760 MHz). It has a triple conversion receiver. The scanner has 20 banks, 10 priority channels, frequency transfer, automatic store and automatic sorting. It features a Twin Turbo Search & Scan (scans 100 channels per second or 300 steps per second when searching), channel lockout key, weather search, data skip feature, selectable antenna attenuator as well as selectable mode. (Can set AM, FM or WFM on any frequency). The scanner also has a rechargable battery and wall adaptor.

For sale: New model Motorola cellular bag phone. Excellent condition and used very little. Comes with everything including case, antenna, battery, charger, and manual. $125. Please do not reply here. E-mail me directly at spectra291@aol.com.

3697. Theory: Uniden 3000XLT CAPABLE of cellular?

Newsgroup: rec.radio.scanner
Date: 1998-05-05 00:00:00 UTC
From: rasputen@fartnet.net
Message-ID: <354f0224.2579910@nntp.a001.sprintmail.com>
Source record: 161308

Many people ask for cell restoration of various scanners, and the replies are invariably "you can't restore what isn't there".

But take the 3000XLT. It has continuous coverage from 25MHz to 1.3 GHz, minus cell. In this case, being the 3000 is a sophisticated radio, I would think that it IS capable of cell, but just blocked by the microprocessor.

Note that I'm not looking for a mod, just intelligent discussion. I'm sure with the right knowledge & hardware it could be restored, except all you need to do is actually buy one & discover it gets cell images...

Speaking of, someone mentioned that images can be received by adding half the IF to the base...can someone explain this calculation in more detail?

R.

SONY used to make one, called AIRSCAN i think. I saw it in a Sporty's Pilot shop catalog a few years back. They are in ohio, search the web for them, i never used it or work for them but I have been happy in the past with their stuff.

>the city either, simply for the fact that heads might very well roll.

Well, heads *should roll* when a local government is giving away $3200 portables to to public -- period. If those were my tax dollars, I'd be PISSED OFF!

So, judging by your post and the information that you've posted -- I'd say you are talking about Memphis TN. Not many other 40 Million dollar ASTRO contracts out there that have been completed and implemented for Public safety systems besides Memphis. Maybe I'll drive to Memphis the weekend and see if they are giving away ASTROs, I've always wanted an 800 ASTRO.

.......or, does anyone else out there have an 800 ASTRO for sale for $25.00 ??? Whew!

Many of those replies are incorrect but stand unchallenged
for good reason.

With recent changes to the law, modifying a scanner to receive
cellular phone calls may be (or become) a crime. Bolster that
with the threat of civil litigation and you see why experimenters
can no longer post or discuss new radio modifications with the same
candor of the "good old days."

Does anyone know of the Etowah Sheriff Offices frequencies other than 154.785 and 159.150. The 159.150 is just the dispatch and repeater so only the 154.785 lets you hear both sides of the conversations. Sometimes they say, "Go to channel four" and in Police Call and on PerCon Corps site the station (KSZ484) only uses the two mentioned frequencies. I've tried scanning on my second scanner to locate the freq they go to but to no avail. If anyone has any info on this stations alternate frequencies, I'd really appreciate hearing from you. Thanks in advance...Bill Privett

Material on your OPP pages are word for word from my writings. Its is
a direct copy of my work. Does not matter where it came from. Its is
my work. Stick it through a photo copier 10 times if you wish. Its
still the same material and wording.

You have said below that

>The FRQ info I got from your site is a follows
>
>the 900 Mhz phones....sorry but thats it....the rest I got from many
>sources... :)

You have already admitted copying material.

As for "the rest I got form many sources"

Do you know who owns or is the author of the material?

I suggest you get permission from others before copying material and
be able to prove your "other sources" especially when it ordinates
from someone who claims it to be theirs and demand you stop using it.

You again admitted where your material came from

>As for material , I obtained mine from MANY sites

copyright laws both local and international forbid you to do so.

Next...

>So pls dont flatter yourself too much....Ohh and ONTSAN means (if you read
>the site) means Ontario Scanner Association......A link Into The North...

You used and continue to use "ONTSCAN" its is a name that not only
is the same as mine but is the name of your pages that contain the
same material as mine.

Does not matter what it stands for. I can not make clothing that
says ADIDAS on it even though it means something different to me.

Next...

>I emailed you....and you didnt reply....Your FRQ about
>Sudbury are WAY out of whack my good man....your Missing 4 FRQ's and how about
>some info on the 800 Mhz system in Sudbury...you didnt reply...you did
>nothing..

This does not give you the right to copy material. You are upset
that you did not get a quick reply so you copy and/or rewrite

material?

The laws of physics establish the noise floor & you can spend all the
money you want going below it, but the only way to get significant extra
distance on a received signal is to add antenna gain (and the narrow bandwidth
& directional characteristics that usually arrive with any gain antenna
design).
Sure, noise filters& digital signal processing can make small gains, but
with no signal to work with, they can't perform miracles. The absolute solution
is crystal control & cavity filters and one receiver for each channel you want
to receive. This doesn't make practical sense and won't fit in your pocket.
Dollars spent on antennas go further than any other dollars you can spend,
once you have a receiver as good as a sub $100 scanner.

Newsgroup: rec.radio.scanner
Date: 1998-05-05 00:00:00 UTC
From: deshi135@ix.netcom.com
Message-ID: <354f46c7.2481261@nntp.ix.netcom.com>
Source record: 161321

Anyone had any luck listening to the Space Shuttle? I have some freqs. and am wondering if anyone as had any luck with them, or can pass on some that they have found.

Air-to-ground 259.7 (AM mode) <--- (AM mode anything other than tuning the scanner to 259.7?)
Extra Vehicular Activity (EVA-space walks) 279.0, backup 296.8
MIR Space Station 143.625 or 143.825

MIR Radio traffic amateur radio:

145.200 uplink/145.800 downlink (can each be heard on these freqs.?)
Mode 2 Packet 435.775 uplink/437.975 downlink
Mode 3 QSO 435.725 uplink/437.925 downlink
Mode 1 repeater/FM 435.750 uplink/437.950 downlink

Is there anything other than just tuning the scanner to these freqs.?
Any help with these questions would be greatly welcomed.

Hey Ron, you are dealing with either a young kid or an illiterate wanna be. His opening page disclaimer should tip you off. I mean you just have to love things like " The information contained herein is NOT copyrighted in anyway , however the files in the file section is copyrighted" or "The author assures no legal liability for any misuse........" . Sheesh!

I understand your frustration though with him stealing your work/material and the using ONTSCAN. This is really a "punk" that you seem to be dealing with. Best course of action is a few E-mails to support@zoom.com and abuse@zoom.com.

Glenn

I beleive this is one of the most important points that has been overlooked so far. The part "to search for specific property" It is not a warrent to look for anything but for specific property in a specific spot like a house or a car or a warehouse.

it may be a written order or an order given over the telephone."
> > The hollywood image of a police officer comming to the door and showing a

3716. Las Vegas, NV- 400 codes

Newsgroup: rec.radio.scanner
Date: 1998-05-05 00:00:00 UTC
From: "william.sills" <william.sills@MCI2000.com>
Message-ID: <Z7J31.1172$8t1.823104@news.internetMCI.com>
Source record: 161327

Does any one have the dispatch 400 codes used by metro? The list I aquired has a bunch missing or a site which would has this information.

thanks;

Bill

>cost a few dollars. The math is well known:

Thanks for a very informative piece (Especially about the wife :))

I haven't tried it out but I made my Antenna from 2 lengths of
coathanger wire cut for my local airport tower Freq. of 124Mhz. This
works well, but much to my surprise it receives cordless phones on
1.620 thru 1.782Mhz FM, which no Antenna I've used before has been
able to do.

Any explanation for this?

Again thanks for a great article,

All the best

Vanlaywan

I've been wondering why no one has written a program to tune
a computer controlled scanner through the handoff of a cellular
system. Can that data be decoded with a standard opamp interface
or with a soundblaster card?
A nice win95 voice channel data decoder with opto support would be
a great rouge internet program!

Its too bad it's just the same mdt decoder listed as a soundblaster
program.

When I use to live in a condo I plugged my scanners into the outdoor
tv antenna for the building. I think everyone in there had cable tv
but there was another rg/6 coax hanging out of the wall which led up
to a roof antenna. It worked excellent! It was a 5 story building so
it was up pretty high. Hope you have one too.

<SNIP>

The OPP SYstem is explained on serveral site...to whom I had permission to use...it is also published by Haruteq!

And many of the OPP info is Avail by my good friends :" The Comm Center "

> (...)
>

> Hey Ron, you are dealing with either a young kid or an illiterate wanna be.
> His opening page disclaimer should tip you off. I mean you just have to
> love things like " The information contained herein is NOT copyrighted in
> anyway , however the files in the file section is copyrighted" or "The
> author assures no legal liability for any misuse........" . Sheesh!

<SNIP>

Your right!

Info is NOT copyrighted , see no copyrigt can exsist unless you see a Lawyer and have your Copy right INFO & #...you MUST also reg this (your laywer will do this for you) with the right agencies.

While the INFO is FREE of anything on my site ,(cuz I did REG the info with my Lawyer) the files however are Freeware...and IF a copyright is there , it is observed...the files may at anytime be sent to whom ever...when ever...

The job of " Policing " a copyright is Long and very $$...Pls email so I may turn this matter over to legal Counsel....Just a family lawyer , but ahh well :)

> I understand your frustration though with him stealing your work/material
> and the using ONTSCAN.

Again , and for the last time...ONTSAN is NOT in the copyright DATABASE in Ottawa....they never heard of Katz nor Ontscan....sorry !!

Stealing work...Hmm...is all the GIF files on anyones site are sucred up with copyright permission...WAKE UP...This is the Internet with Zillions of systems and ppl....I STOLE nothing , and if you or Mr.Katz wish to think so...that is fine...all you need to do is Provide my Laywer with Proof of Ownership....(you get that when you do a legal Copyright) and from there seeing as no revenue was ever generated by myself , it is 100 % up to me waether I wish to take it down..

Matter of fact...change 3 words (read your Copyright Law) and it is now yours ...so to speak...

Look Dummies..all I tried to do was provide a good web site with good stuff on it...and get many ppl to see what we can do to enhance our hobby....Seeing as Katz and whom ever this is I am replying to..(never paid attention) keep this up..I will simply do what MS did...to Big Blue....REVERSE ENG the info...now ya cant bitch!

#1. I asked , lets go to PVT Email..and sort this out....you did not

#2. You continue to DRAG this on , with no value to the readers of the NS , they want HARD facts on new systems...tips...help...NOT this BS

#3. Now I have this post to reply to..I have no idea who you are!

Best advice!

Keep your Nose out of it...if Katz wishes to go forward , then so be it..I do like a good Court room battle...(theres a HINT for my occupation)

As far as my sever is concerned....NO BIGGIE...again...its a legal matter between two parties....does not violate any server or USA laws...nice try tho :)

Have a great day!

Remember Do Visit http://members.xoom.com/ontscan/

This is the last POST to this matter....Flame all ya want now...PVT email only...I will say sorry to the readers of this NS for WASTING thier time reading the Posts by the above 2 persons...Sounds like A Cheeck & Jonny war to me...to which I will be NO party to...

:)

This is really a "punk" that you seem to be dealing
> with. Best course of action is a few E-mails to support@zoom.com and
> abuse@zoom.com.

I have a Radio Shack Pro-60 handheld scanner for sale. It is in
excellent shape. Here are some of the features of the scanner.

1. 200 channels (10 banks of 20 channels)
2. 10 monitor channels
3. Triple conversion (Eliminating most interference)
4. Can be powered from AC outlet (AC adapter included)
5. Can also be run from 6 AA batteries (alkaline or Ni-Cads)
6. Batteries can be charged while in the scanner.
7. Battery saver feature.
8. High Speed "SEARCH MODE" (To find hidden frequencys)
3. These are just some of the features, there are many more.

The Pro-60 covers the following frequency's

1. 30.00 MHz to 512.00 MHz
2. 760.00 MHz to 824.00 MHz
3. 849.00 MHz to 869.00 MHz
4. 894.00 MHz to 1000.00 MHz

To see more of the Pro-60's features go to the following.
http://support.tandy.com/support_electronics/doc15/15350.htm

To see a picture of the Pro-60 go to the following.
http;//members.aol.com/cozyelm/pro60ful.jpg

To see a picture of the Pro-60's keyboard go to the following.
http://members.aol.com/cozyelm/pro60key.jpg

The above 2 pictures is the actual scanner I'm selling.

I do not have the original box it came in or the owners manual. the
owner manual I do have is a copy. The scanner also comes with the AC
adapter and the rubber ducky antenna. If you have any questions
email me. I'm asking $150 for the radio plus shipping & handling.

Remember - an officer does not develop probable cause when you refuse to let him search your car. He may not like it, and may think you are hiding something, but that does *not* give him P.C.. Your assertion of a constitutional right does not divest you of that right!

From the cops I know, the best thing to do if you are pulled over is BE NICE! Call him Sir, don't be a jerk, and they generally will not be jerks back. You can refuse a search without being a jerk.

Purchase a TV amp from Radio Shack along with some BNC adapters and the whip antenna you mentioned. Placed together you have a sudo-active antenna system for under forty-dollars. The whip length can be adjusted to the bands you listen to the most. The adjustable 20-30 db amp covers 50-950 mhz and works quite well. My cordless phone reception range has tripled and have noticed improvements in all bands. E-mail if you need more info.

Hi John,

Try not to get to disheartened. Go back into the case with a bright lamp and a strong magnifing glass and look for metal chips. If luck is with you the setback is only temporary and easy to fix. In the future you might consider buying a Roper Whitney metal punch which works great for that kind of job. Good luck and let us know how it goes.. Mike K8MB

Some courtsey and being upfront about having a scanner in the car will work wonders. Explain that your a hobbiest, working on becoming a ham operator or member of a vol. fire dept./first aid squad. I'm covered by two of the above and the local law enforcement will ask me at a fire scene what is happening because they are aware of my hobby and don't have access to all the radio services.

1620 khz was used as the base freq on very early models of cordless phones. One of the reasons I became involved in scanning when i was expermenting with cheap AM portible radios and re-tuning them to receive SW. I stummbled upon my first cordless phones right above the AM broadcast band twenty-five years ago.

That is certainly correct. I have spent some time working as a Public Defender, however, and this does seem to be changing. Judges, and to a smaller degree prosecutors, have begun to not only doubt the too frequently-manufactured, post-arrest developments of probably cause by police officers, but to discount them, and even refuse to prosecute based on them. In a recent case in South Bend, a Judge threw out the conviction of a defendant arrested for, I believe, possession of drug paraphenelia who was stopped for a tail light that was allegedly out. This allegedly burnt out tail light, the judge found was merely a pretext for the stopping of three black guys driving around late at night. Consequently, the judge tossed the case.

It has unfortunately been the case for far too long that a prosecutor will often accept blatantly manufactured P.C. and other evidence in order to support his or her case. This can backfire, however. Take the case of Rolando Cruz in DuPage, Illinois. Jeanine Nicarico was raped and murdered when she was only ten years old, in 1985. Within a short period of time, Cruz and two others were arrested for those crimes. Cruz and one of the others were convicted, and sentenced to death. Shortly after his first conviction, another man was arrested for another murder, and admitted to the rape and murder of Jeanine Nicarico. In 1988, Rolando Cruz' first conviction was overturned, and he was retried. Again, even though another man had confessed to the crimes, Rolando Cruz was convicted, and again sentenced to death. In 1994, his second conviction and death sentence were overturned, and Roland Cruz was tried again. In this third trial, a number of witnesses admitted that they had perjured themselves, and significant evidence that much of what police had said was likewise perjury. Cruz was acquitted, after serving twelve years in jail. This is certainly an extreme example, far removed from the garden variety manufacture of P.C. that goes on every day. However, the extreme upheaval caused by the Cruz case has begun to filter down. As the prosecutors are being sued civilly and, I believe prosecuted criminally, for their actions, prosecutors are much more leary, even in the minor cases, when considering police reports.

This is far from a solution, I know. A hearing on the suppression of evidence will almost always turn on the credibility of the witnesses, as well as the evidence presented by the state and the defendant. I guess the message is, be nice to the cops, even in denying them their request to search your car. (Many jurisdictions now require their police to secure written waivers in order to search a vehicle. This alleviates the problem where it is the case.) Further, make yourself as credible as you can, and appear that way to the police. (I know this is rather nebulous, but hey, that's why I studied law. . .). If there are other people with you, it just bolsters your case for suppression.

Meanwhile, if more of the people aggrieved by this "garden variety" manufacturing of P.C. would file suit under ï¿½1983, even if they did not win, they would cost the state a considerable amount of time and money in defending such suits, and this would filter down to
effect the actions of police more than many people realize. When prosecutors start letting people go because of a suspicion that the cop manufactured P.C. or evidence, you can be

sure
that this process will begin to die on the vine, so to speak.

>Talk about 'civil servants' !

First off, I assure you, this is not a troll. I am not comfortable in naming the city either, simply for the fact that heads might very well roll.

The new radios were not "officially" labeled as surplus, they were just taken out and sold out the back door. The entire city went over to the new $40 million + digital system over a years time, beginning with the water department, and ending with the police department switching over. Many radios were lost in the shops during this time. (Note: I do not work in the shops of this city, but I know people who have obtained radios from people that they know who do work at the shops)

Just to give another example of how many of these radios just end up lying around: The handhelds ordered for the fire department are not waterproof, they must be bagged and carried under turnouts, with only the speaker mike exposed. If you go into the fire departments alarm office, there are usually over 20 or so new handhelds just laying around drying out, some need to be worked on, but when examined, most work. I know of a couple of people who knew some of the firemen at the alarm office, who were given radios by the firemen there.

All my post is saying is that if you really, really want to monitor your city after they go digital, there is a way, it might not be easy, but I assure you, these methods did indeed work in this instance.

Ok, Ok, some of the managers are pretty good. You have to be careful of the
used junk though. I just picked up the HTX-404 440 ham rig for $99 brand new!
The manager knows me well enough by now that he looks for things that are
going discontinued and tells me about them when I go in the store.

3758. MDTW1234 ALLINONE Interface Layout Error

Newsgroup: rec.radio.scanner
Date: 1998-05-05 00:00:00 UTC
From: MDTW1234_Support@spectrum.org.bogus.address
Message-ID: <Ofv31.33261$971.7890485@newsgate.direct.ca>
Source record: 161384
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Ken H. in Australia has reported an error in LAYOUT.BMP.
The incorrect diagram shows R1 tied to both the plus and
minus leads of CN1. This is incorrect.

R1 should be tied to Pin2 of U1 and the minus lead of CN1.

The ALLIN1-A.ZIP file at the following URL will be corrected
sometime during the next 24 hours.

If you have an ALLIN1-A.ZIP file that contains LAYOUT.BMP
with an archive date prior to May, 1998 then you should
download a new archive and correct any interfaces you have
built using this document.

Then the guy lied to you.

Nevertheless, the BC-760XLT is modifiable for cellular,
depending on which modem you have, the procedure
varies slightly.

You can find that information on my FTP site at:

ftp://204.210.11.204/mod_info/radiomod/

and if that one doesn't get it, then try:

ftp://204.210.11.204/mod_info/moremods/

and if you strike out there, try this one:

ftp://204.210.11.204/mod_info/megamods/

Remove transistor Q108, remove the associated resistor going to its emitter, use white-out to cross out the "a" in 700a and write in "b" with a black marker pen.

Consider your radio "modified". You will notice difference performance too.

> search warrant could be obtained."

Although not in that case, there is a THIRD reason that the courts have
accepted for warrantless search: A cursory search for a weapon. The
officer has a right to secure his own safety.

Note that if one challenges (i.e. requests that the officer state)
probable cause and the officer cannot identify it, probable cause does not
exist i.e. cause must be identifiable.

> not real.

Actually, that may depend on the state. In California, there is a requirement that any warrant, upon execution, be "in hand" (although, it need not be in the same hands as the officer conducting the search - it can be in the hands of an officer on his way to the scene.). For arrests pursuant to warrant, it MUST be in hand (CA PC 849? 850? - I forget exactly which section.) There is a further requirement that the warrant must be shown "as soon as practicable" if demanded by the suspect.

3769. Help with my 2006 NFM

Newsgroup: rec.radio.scanner
Date: 1998-05-05 00:00:00 UTC
From: John Schneider <oldcop108@worldnet.att.net>
Message-ID: <6im62k$grg@bgtnsc01.worldnet.att.net>
Source record: 161395

At the risk of getting flamed...
A few days ago I had tapped in to the descriminator, (TP2), of my 2006. When I had finished I realized that I had done something to make the audio of any freq. in the NFM mode impossible to hear unless the volume control was set at the 5:00 position, (WFM and AM seem to work fine). I also realized that I had somehow managed to screw the squelch up as well. I hear what appears to be a rythmic opening and closing of the squelch until I set it so high that I know the squelch will not break at all, (again...WFM and AM appear to be working fine).
I drilled a hole in the rear plate of the scanner to facilitate a RCA female jack, to which the descriminator tap was attached. I did a very sloppy job as I know I got metal shavings onto the PC board. I used compressed air and thought I had removed all of the filings...maybe not. It also ocurred to me that I may have overheated something when I was soldering, I guess anything is possible.
So here I am...throwing myself on the mercy of the newsgroup in an attempt to obtain a small piece of the gathered intelligence, (yours..not mine)! I extend my gratuity in advance for your anticipated suggestions and advice. Thank you.

: >Dave
: >

The date on the manual has NOTHING to do with the date that the scanner
was manufactured.
If the unit was produced before April 1994, it can be modded-the usual
"mod" sites have the data.
If it was made later, then it won't mod directly, but a virtual
downconvertor mod should be possible.
Also, the 760 images well, so scanning 21.? above the desired range will
work too.

I returned a Pro 2045 to Radio Shack so I could upgrade to the BC 895, but soon after, realized I like the 2045 better. I liked the button layout and larger frequency display better. The hit counter is neat too.
The 2045 was on clearance sale for $129 last weekend (down from $349), so I bought it. Now I'm trying to pass the 895 on to someone who will use and enjoy it.
Thanks,
John

Check onsale.com for reconditioned phones sold at auction for nice
discounts. I've bought a Sanyo and an ATT 900MHz SS phone there, and
both work fine. They currently have the ATT model starting at $49.

Shipping and handling will cost you about $10.

>scanners

>Buying >the BEST is

Your options for a TT handheld are limited, at least for the moment. There's the BC235 and the PRO-90. They're virtually identical but the Uniden comes with an extra battery pack.

The other issue is what "best" is and why you would equate "best" with the ability to pull in distance signals. If that is what you are mainly interested in you should spend your money on a decent antenna (rooftoop, attic or a decent whip--whatever you can manage). Your complaint about the A8K suggests that you haven't done that..

Looking around the net I note that I have yet to see a resource that has compiled a list of the major brand models that recieve Cell. As many scanning enthusiast enjoy such a pursuit, it seems like this would be a welcomed addition to the nets resources. Has anyone seen such a listing? Sure would be nice for those new to scanning to download such a list and take it with them when checking out thier local pawn shops and garage sales for that bargain priced pre-94 scanner. Post-94 scanners that were capable of cell mod could be denoted as well. If anyone has seen such a creature- Please post.

>> Does anyone know if the BC895XLT or the Pro 2042 receive 800 MHz images? Also, can anyone compare these radios?

>I own both, and haven't found images on either. I personally like the BC895 better.

I also own both and I have become quite fond of the BC895. I use it most of the time now. The 2042 has Opto and Programit interfaces in it and its far more flexible and capable than the BC895 as long as I'm willing to run it off my PC.

If I had to decide between the two, however, I would probably go with the 2042. Trunking is definitely a worthwhile feature but listening to trunked systems in my area is not the main reason I use the scanner.

>> important for rail scanning.
>
> Uh, what's the web address?

If you want to increace performance even more for whatever
scanner you choose and about all you're going to listen to is the
railroads, go for a tuned antenna. I did at a hamfest a while back and
notice the difference.
I now swap between the stock antenna and the tuned antenna
depending on what I'm listening to.
You can get them from Smiley Antanna Co. at:

http://www.htantennas.com/

The antenna that I use in particular is part number 16020, 5/8
slim duck. It cost me $17.95, and in my opinion, was worth the cost.

3791. Re: BC 760 XLT: Unblocked??

Newsgroup: rec.radio.scanner
Date: 1998-05-06 00:00:00 UTC
From: ddhartwick@innernet.net
Message-ID: <19FBB51FCC53C4BF.E580A7F8DD36F4F1.4D5BC7728D0BE1A6@library-proxy.airnews.net>
Source record: 161216

A Call to Uniden revealed the fact that my BC760XLT was made in
'93. It must be blocked. Anyway, we have a cell tower just about in
our back yard, so I receive scads of undistorted calls in the 895-915
mHz range, though one side of the conversation is frequently missing.
Several have mentioned modems. Excuse my ignorance, but, modem in
the scanner; or are we talking about using the scanner in conjunction
with a modem equipped computer?
All of this having been said, I've got to say that the illegality
of it all spooks me. We are aware of the disproportionate way in which
The Feds dole out punishment--Let the murderer go and nail the
eavesdropper to the wall. Combine that with the generally
uninteresting, profanity filled nature of these conversations, and
I've got to say--no thanks. It's just that the Hamfest vendor I bought
this scanner from told me that it was unblocked. I suspected she was
fibbing, and I was right, apparently.
BTW--is it illegal to monitor cordless phone calls? I assume it is
not.
Dave
Just a note: The 760 seems to be much more sensitive than the RS
PRO-90; particularly in my main area of interest: the Air bands.

>I just bought a BC760XLT ($100.00-- vintage 1989, acoording to the

Haruteq or several sites, who cares. It does not make it legal to
copy material.

>And many of the OPP info is Avail by my good friends :" The Comm Center "

Sure, if you say so.

>
>> Hey Ron, you are dealing with either a young kid or an illiterate wanna be.

Can't argue much on that point. He seems to be using a server in
Algoma did a IP search and its from the
"Algoma District Social Services" server. Seems like he go server
access to help find a job. Can't be to bright when Social Services
are involved eh!?

>> His opening page disclaimer should tip you off. I mean you just have to
>> love things like " The information contained herein is NOT copyrighted in
>> anyway , however the files in the file section is copyrighted" or "The
>> author assures no legal liability for any misuse........" . Sheesh!
>
> <SNIP>

Sound like its just a young kid wanna be to me. How can one get too
upset when dealing with someone who just wants so much "to fit in"

>
>
>Your right!
>
>Info is NOT copyrighted

Depends on what "info" your are talking about.

> , see no copyrigt can exsist unless you see a Lawyer
>and have your Copy right INFO & #...

what is it "copyrigt" or "Copy right" Think you are trying to say
"COPYRIGHT".

You are wrong again. It least my lawyer thinks so.
He specializes in copyright. At $250.00/Hr I'll let him do one thing
at a time thank you. Besides your small potatoes. Your turn could
be next though, you never know.

>you MUST also reg this (your laywer will
>do this for you) with the right agencies.
>
You've been playing on the computer too long it seems to have affected
you thought process.

>While the INFO is FREE of anything on my site ,(cuz I did REG the info with
>my Lawyer)

Yeah okay......

> the files however are Freeware...and IF a copyright is there , it
>is observed...the files may at anytime be sent to whom ever...when ever...
>
knock knock..... any one home? "IF a copyright is there, it is
observed" What your not sure?

>The job of " Policing " a copyright is Long and very $$...

Not at all. If you only knew. My lawyer is only $250/hr and if you
are "taken on" and loose you end up paying my solicitor/cliant costs.

In your case I guess it depends on how much you have left at the end
of the month.

As for a long process,.. If you only knew, boy if you only had the
slightest idea.............

>Pls email so I
>may turn this matter over to legal Counsel....Just a family lawyer , but ahh
>well :)
>
You use an anonymous email address, post to newsgroups via an
anonymous news server and connect through "Algoma District Social
Services" You talk about your "family Lawyer" Is it the one dealing
with the problems in your family and because "social services are
involved"

Sound more like a social worker not a lawyer.

Its nice of them to give you access to the internet. They say it
helps you learn to interact with others.

Oh... about the social services thing. Got the IP from the headder
of your last post did a trace route to it "204.101.200.166"

DNS told me your ELR2ast01-12.adss.on.ca [204.101.200.166]

http://www.adss.on.ca

You were assigned a dynamic IP address from Algoma Social Services.

Records show that you are a dial up account. Further information
was available and let just say you may find that your misconceptions
about copyright laws will be cleared up for you faster then you think.

>> I understand your frustration though with him stealing your work/material
>> and the using ONTSCAN.
>
>Again , and for the last time...ONTSAN is NOT in the copyright DATABASE in
>Ottawa....they never heard of Katz nor Ontscan....sorry !!

I never heard of my next door neighbors playing her piano and
composing her own music. If I record it and play it, sell it or
distribute it to others it going to get me in some hot water. Its
just a list of musical notes.

>Look Dummies..all I tried to do was provide a good web site with good stuff on
>it...

What you tried to do and what you are doing are two different issues.
The fact remains that

You copied material from others. Period.

>and get many ppl to see what we can do to enhance our hobby....

You are not enhancing the hobby.
You are also taking away from it.

What your real reason is I'm not sure. Maybe its attention or you have
some personal grudge against me.

Fact is I spend many hours a week maintaining my pages, dispute what
you may think. You take away from the hobby by copying material,
unique name and format and make a web page of your own out of it.

You took something away, the fun of it for others. What is the
point of posting the information I do. If the fun hobby aspect of it
is gone I might as well just sell a book like everyone else. What's
left.

>Seeing as
>Katz and whom ever this is I am replying to..(never paid attention) keep
>this up..I will simply do what MS did...to Big Blue....REVERSE ENG the
>info...now ya cant bitch!
>

Yeah yeah yeah...

>#1. I asked , lets go to PVT Email..and sort this out....you did not
>

You make public posts advertising your web pages that are copies of
material of mine, name and format. You made it public and I
followed up on it. This is not a email issue.

>#2. You continue to DRAG this on , with no value to the readers of the NS ,
>they want HARD facts on new systems...tips...help...NOT this BS
>

I am exposing you for who you are. A fraud. You are the one who can
control if this will drag on or not.

>#3. Now I have this post to reply to..I have no idea who you are!
>

The questions is better put as "Who are you?"

>
>Best advice!
>
>Keep your Nose out of it...if Katz wishes to go forward , then so be it..I do
>like a good Court room battle...(theres a HINT for my occupation)

The only hint I get is that your are a FRAUD. Why do you have to
hint? What is your occupation, if you have one.

>
>As far as my sever is concerned....NO BIGGIE...again...its a legal matter
>between two parties....does not violate any server or USA laws...nice try tho
>:)

If your posts are being done one someone server and they have final
control over what remains on it and what is removed then they too are
liabale. Hay but you a laywer and you know that right?

3802. Chevrolet remote freq?

Newsgroup: rec.radio.scanner
Date: 1998-05-06 00:00:00 UTC
From: grubekg@t-online.de
Message-ID: <6iqbj6$jm5$1@news00.btx.dtag.de>
Source record: 161227

Hi!
The '89 Blazer has a remote for door locks ect. and it doesn't work with infrared, so it must be a radio transmitter. Does anybody know the frequencies those use?

Mike

3803. IC-PCR1000 Mod

Newsgroup: rec.radio.scanner
Date: 1998-05-06 00:00:00 UTC

Date: Wed, 11 Feb 1998 00:12:43 -0330 (NST)
From: Carl Hodder <sba3020@InfoNET.st-johns.nf.ca>
To: editor@qrz.com
Subject: ICOM IC-PCR1000 frequency mod.

RADIO: ICOM IC-PCR1000 COMMUNICATIONS RECEIVER.

SUBJECT: ICOM IC-PCR1000 FREQUENCY MODIFICATION.

You've been waiting.

You've been told it can't be done.

You don't want to pay for it.

Here's how you do it.

The PCR-1000 full coverage mod:

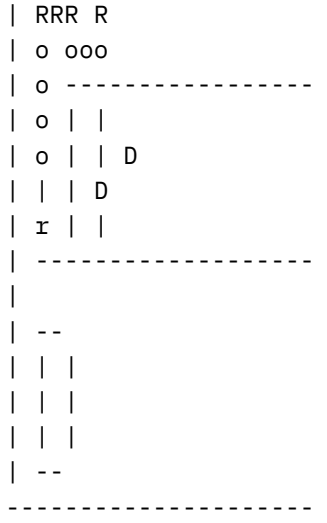
What you'll need:
Small philips screwdriver
Slightly larger philips screwdriver
Soldering iron with *very* fine tip
Xacto knife, or other sharp tool
2 0-ohm surface mount resistors, 0804 in size, or
30 guage wire-wrap wire
No fear of surface mount components
Ability to follow instructions

Very very very first step. Read ALL the steps before starting. Make sure you feel comfortable making a mod of this nature. It's not rocket science, but it does require a steady hand.

There are three things that can happen as a result of this mod. 1) You're completely successful. 2) You screw up a surface mount pad, but the radio still works when you're done. 3) You're a total hack using the wrong tools, and you send the radio back to Icom for repair.

Hopefully, you're a result 1 type person. At worst, you're a result 2. If you think your going to be a result 3 type, don't even start. Call a friend.

We've done this mod on 2 radios with complete success. We can't guarantee that in later radios this mod will still work. It works at least with serial numbers up to 1111 in the last 4 digits.



Let's get started!

Remove the 8 screws that attach the cover, and remove the top
cover of the radio.

Orient the radio so that serial, power and RF connector are
closest to you, and the power switch faces away from you.

On the PC board closest to you, in the upper left hand corner
you should see a 80 pin surface mount chip. It has a number such as
64F3334 stamped on it. This is the processor.

Near the upper left hand corner of the chip, you should see 2
small green 0-ohm resistors. To the left of the two resistors you
should see an unpopulated pair of pads. These are the 3 "R"s below,
on the left. The 4th "R" is used for location reference below.

(Picture courtesy of Alan Adamson, NE1H)

Using the soldering iron and knife, *carefully* remove the
right hand resistor. You'll need to alternately heat the two ends,
while apply a *light* pressure with the knife. Once it's hot enough,
it will left off. It's very easy to destroy the pads the resistor is
soldered to, so be *careful*.

You'll now need to short the pads of the left resistor (this
is the unpopulated one). You can either try and re-use the resistor
you just lifted (least good idea), short them with a short piece of
wire wrap wire (OK idea), or use a real 0-ohm resistor (best idea).

For the next step you have two options. One option is easy
and does not require removing the board from the radio (recommended).
The other option is "more correct", but will require disconnecting all
the cables, removing the 5 screws that hold the board down, etc
(purist method). We'll presume you're more likely to want easy, so
here are the steps for it.

Keeping the radio oriented as described above, look below the right hand resistor (the one we removed). You should see 3 vias (holes) (see picture above). Follow the left most via, and it should go to the left most pin of the processor. The second via should go to the next pin to right, and third via should go to the pin to right. At this point, you should see two pins that don't appear to be connected to anything, then a pin that connects to a small black resistor marked 201 (this is the 4th "R" in the picture).

If you've sucessfully located the 6 pins above, we want to short the pin that is the 4th from the left to ground. Above these 6 pins, you should see a small black rectangle, with 8 pins. I believe it is marked 220. On the side of this part (it's a resistor pack), there is a pin that is soldered to the ground plane.

To short the 4th pin from the left to ground, tack a wire to the pin. Be *very* careful not to short the adjacent pins to the 4th pin. It's very easy to do. It you do, use a piece of Solderwick or coax braid to remove the solder. Better yet, don't short the pins. Tack the other end of the wire to the pin on the resistor pack described above.

OK, you'd rather do it the "more correct" way. Disconnect all the cables from the board. You'll need to remove the shield from the RF section to remove the white ribbon cables. Disconnect the power and speaker cable. Remove the 5 screws that hold the PC card down. Remove the card from the radio.

Orient the board as described above. Look for the white connector above the packet connector (lower left). It's marked J12. Just above that are a pair of solder pads for a resistor. One side goes to ground, the other goes to a via. Follow the trace on the bottom side of the board. You should see that it goes to a via, but that the trace has been cut right next to the via.

Using a sharp knife and a lot of care, scratch away the solder mask to reveal bare copper on the trace. Use a piece of wire wrap wire to repair the cut trace (bridge the trace to the via). Back on the top side, short the pads for the resistor that are open (this is the lower case "R" on the left, off by itself).

Reassemble the radio. If you used the "more correct" way, make sure you get all the screws and cables back in.

Plug it in, turn it on, fire up the software. Tune a frequency you couldn't before. If you can tune it with the software, and the squelch is open, you're working!

If it's not working, review everything we described. Make sure you didn't short any pins. I can't offer you much more help if it didn't work.

Remember, you screw up your radio, it's not my fault. I don't work for Icom, I don't represent Icom. I don't endorse listening to

frequencies you're not supposed to, and can't be held liable for anything that happens, anywhere in the universe, as a result of you making this mod, or even thinking about making this mod (Gawd, I hate lawyers. CYA!). This mod was done completely from our own experience and background, and did not reference any material. We don't know about these people selling the mod on the 'net, but we didn't steal it from them.

Hope this helps. If you've got any suggestions to improve how to make this mod, please send e-mail. If you made this mod, let us know how it went. Also, if you want a list of the PCR-1000 commands we know about, drop us e-mail, or use DejaNews(tm) and search the alt.radio.scanner groups for the post (look for PCR-1000 in the subject).

- Chris, KD4DTS

(Thanks to Alan Adamson, NE1H for his being ready and willing to sacrifice his radio to a higher cause, and his drawing).

It doesn't much matter in this case, because the canceller's identity wasn't stated and the headers lacked !cyberspam! and a Salz ID.

The only way these cancels would be legit, is if the person who sent the cancels is also the holder of the AOL account. That happens on occasion, because AOL doesn't let you cancel your own articles except by emailing them and asking.

Rick:

I live in Warren, Michigan. Using the Miracle Baby antenna, on most scanners, I clearly receive Warren, Madison Heights, Troy, Sterling Heights, and several other surrounding cities with no problem. I can even pick up Detroit, which is about 30 miles South of me. Detroit operates in the 453 MHz band, and uses very high towers, which has a lot to do with the success.

It works best on the 800 MHz band, good on the 450 MHz band, no so good on the 150 MHz band, and you can forget it on the 48 MHz band.

I got one of these two days ago according to ICOM first one bought in
Australia!!! Its great and I like it even more than a VX-1 because its not
yaesu!!!!! what can I say its a 30-1309MHz scanner AM,FM,WFM and it transmits
aswell! Has better sound than my IC-T8 and it was $AUS350 which is about 2/3
of a VX-1!

Its a great radio e-mail me if you want more info.
cheers
ERIC.

I don't know about now, but when I worked for them (mid 70s), we were
paid min wage plus commission. The commission was 10% on all sales,
if I remember, but it was only paid on amounts sold above a monthly
floor amount. The floor amount varied; we were expected to sell more
at Christmas than at lesser celebrations like Feb 28.

I was a salesman. Managers and the like were paid differently.

I think I remember someone telling me that the entire commission
methodology was revamped shortly after I left their employ.

I have the one with the BNC connector. It actually completely attenuates a 155.295 MHz EMS dispatch station two blocks away. It works half decent on UHF. 800 MHz reception doesn't seem to suffer very much, though.

> > > Icoms new HT. Anyone have more info than the HRO catalog? Scan banks,
> > scan
> > > edges, external power??? I have some specs and a small picture. I can
> > > e-mail if interested.

It has a variety of scan functions. These include all scan, band scan, edge scan, 0-99 memory scan, 100-199 memory scan, all memory scan. Memory channels can be programmed to be skipped in all memory modes and VFO scan modes if noisy, noisy channels can be auto programmed in vfo scan modes. there are 10 edge scan banks which use any of the 200 channels or call channels, the edge bank simply has the channel number s in it which you wish to be the upper and lower frequency limits! There are also three priority scan modes. While in VFO check sellected memory channel every 5 sec, or increment to next memory channel each time(skips channels can be programmed) or check call channel every 5 sec. Radio has no external power input, I have been using alkaline batteries for the past 2days almost non stop still getting over 450mW on TX!! Have got 4 AA size 1.1AHr NiHi batteries so I can swap but have had no need to. Having disasemled the radio I have found that there is enough room for a DC connector near the top opposite the PTT and will be putting one in when I obtain a spare back! My second option is to obtain a new battery cover and use this to make a NiHi battery pack with built in charger cct and a plug! this would probably be more favorable however with the right bits I can make both look original. If people are interested I can make and sell these. My only complaint so far is the really stupid belt clip the one on the IC-T8 is much better and I have already modified one to suit.(cut the width of the tang down! it still makes the radio quite fat though so I might make a S/S one. The original one is very curved and hard to place onto the belt with one hand it is the same as on the IC-M1 and I have know of two radios being lost on SAS operations because of the poor belt clip design. Thats about my only gripe I think. I would have to guess that if VX-1's only cost US$250 now in the states with a little shopping around then $175 would probably be a suitable figure for a new one of these over there! I payed AUS$350 which is US$220 curently but our ham gear is considerably more expensive hear. I would have to say that it is definately one of the smallest scanners available.

cheers
ERIC.
P.S. I'd be interested in any more info on it please email me on eric_fre@hotmail.com

is
>> > not real.

Well, maybe, maybe not. Depends on what you are searching for. If you're
looking for a stolen refrigerator, you exceed the scope of the warrant if
you
look under the cabinets, in drawers and under the bed. But search warrants
for items that can he easily hidden often do authorize a general search of
the described premises. A gun used in a homicide can be hidden in numerous
places. The Officers don't have to know exactly where the item is, just
provide the Judge with enough probable cause to believe that it is in the
premises
to be searched. Same way with drugs, they're often scattered in areas all
over
the house or car.

3827. Building a J-pole

Newsgroup: rec.radio.scanner
Date: 1998-05-06 00:00:00 UTC
From: Scott Vieth <svieth@ameritech.net>
Message-ID: <3551177D.A4D7FE62@ameritech.net>
Source record: 161252
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi:

I just read the April issue of Monitoring Times and saw the article on building the J-pole antenna. This seems like a neat project. After reading the article, I searched the web a little and found that J-pole antennas can be made from twinlead or copper pipe.

Which material works better?

I'd like to make my own antenna for the 108-137 MHz aircraft band. Should I base my calcuations for the J-pole on the middle of the band (around 122.5)?

Does anyone have any tips for us J-pole first timers?

Thanks.

-Scott

>me.
>and as well for all the negative bullshit remarks That will follow
>along too.
>

As for the last comment...I think that it would attract more flies
than anything else. I definately have liked PROBE for operating my
Pro-2035/OS535 and Pro-2042/OS535 setups. It is DOS based, but I run
it on my 200MMX at blazing speeds with Win95. As for the MODERN
appearance...do you want something that works well on a large variety
of computers and does its job well, or do you just want something
pretty to look at on the screen!! It would be nice to see Probe with a
few more features such as Spectrum Analysis or a Band Scope, but it
does exactly what it says it is going to do and does it very well. You
should be able to get up and running with this program quite easily.
To help with getting up and running quickly, it would be good to
either get some freq database CDs or grab some data from the ScanWare
site and manipulate it so you can import the data into PROBE.

Have one Motorola HT1000 UHF (hi-split) 16 channel radio that has a problem with PL decode.

Radio transmits fine and receives fine on carrier squelch, but reception on CTCSS is spotty.

Radio has been re-cased and is a "10" cosmetically. Will sell for $125.00 (no battery). Add $25 for a new standard charger.

>Any help would be greatly appreciated.

Ray,
In the April 1998 issue of "Monitoring Times" on p.20, there are plans
for making a J-Pole antenna. Made it a couple of weeks ago and was
suprised how good it worked indoors. I live on the first floor of a
condo building and have a bit of a antenna problem myself.
I also have been using a GRE Super Amplifier 3001 for about 5 years
now and it works well. I think the suggestions on the TV amps from
radio shack will do the same thing if not better. My 3001 was about
$60.00 back then. I think the added gain is 20db?

Good luck.
Tom

Source record: 161269

Uniden Bearcat 3000XLT handheld receiver.

25 mhz to 1300 mhz coverage (minus cellular) will receive images around 1000mhz
400 memory channels in 20 banks
Scans 100 channels per second
10 priority channels
Automatic search and store of frequencies
Attenuator-switchable for each memory
Data skip
One touch weather
Rechargeable battery

This receiver is arguably the second best handheld receiver to the AR8000 at half the price. I can say that because I have had about a dozen of each. I will sell this mint radio with box and manual for $210 shipped.

Thanks K4TJK

From: kramers@cinternet.net
Message-ID: <354fccea.0@news.one.net>
Source record: 161271

Does anyone know the Frequencies used by Infrared Remote Control Extenders?

I have a device made by RCA that allows an infrared remote to be used in another room to control (a DSS receiver) from another TV...other than the one that the DSS is near.

It uses an RF link to repeat the infrared signal. I think it is some kind of wide band uhf (like a garage door opener uses). Perhaps in the

225-400 Mhz military UHF aero band?

I believe my neighbors extender interferes with mine and I want to investigate further with a wide band communications receiver. (R-7000)

What is the detector type and the Freqs used?

Thanks!!!

Half of those codes Metro doesn't even use.

I'll send you an e-mail of the current LVMPD 400 codes.

Robert

PARG Press release

PARG International - PHANTOM'S AMATEUR RADIO GROUP INTERNATIONAL (PARG), will sponsor
the annual Dayton Activities, Dayton Dinners, and Interference Committee activities
again this year. PARG is the only visible and service orientated group for radio
hobbyists dedicated to preserving the high integrity and traditional values of amateur
radio, showcasing the hobby as attractive/fun for all, and promoting relationships
between men and women in amateur radio. The PARG Hospitality Suite will be open to all
members & guests. PARG members and friends are asked to check in on the PARG repeater
during Hamvention on 443.575 Mhz (+ offset/100 Hz) for times/locations. President
Justin Bousquet and Co-Founder Larry F Johnson are a part of the speaker program.
Topic of discussions will include LIDS, Internet, and Amateur Radio. Please see the
PARG web site HTTP://WWW.PARG.ORG or write to pio@parg.org.

After having my new os456 for the last few weeks I've found every demo program available to be really disappointing. I can't even seem to find any dos control programs at all. Which programs do other owners use?
Anyone using Probe? It looks like the only decent one around, but the sales pitch for all of them looks good...and I can't find a demo for it. I'm glad trunker is such an awesome program, or I might not like my new toy so much...

Hi Dave,
The HS200 is a great radio and has a very high "satisfcation
rate" among its owners. I'm sure the HS100, which is an HS200 with
half the channels and no CTCSS/DCS, will perform likewise.
While each user's environment creates a unique opportunity
for interference from local signals, you'll probably find that
the HS100 is better suited to the task. Monitoring rail freqs
seems to be particularly troublesome these days due to receiver
designs and the subsequent interference from strong pager signals.
The HS100 advantages also include your choice of batteries(the
SportCat forces you to use a proprietary ni-cad cell), better
audio, a backlit keypad, S-meter and rotary tuner.
I think that, by now, you should see the direction I'm
heading ;-) Best of luck with your decision!

>After having my new os456 for the last few weeks I've found every demo program available to be really disappointing.

The sad truth is that in general software for the OS interfaces is only "okay." The Windows programs are ugly and over priced...

>I can't even seem to find any dos control programs at all.

Probe is a DOS-based program.

>Anyone using Probe? It looks like the only decent one around,

Yes, I agree that it is the best. It has several features optimized for the OS interfaces, for one thing. Rather than go into why it is the best thing available, go to Steve's Hancock web site: http://home.ptd.net/~pro2006/. It is far and away the best site covering Probe, the PRO-2006 and the OS interfaces. He's got the latest reviews on Probe 4.0, the new version that you should take a look at.

>I'm glad trunker is such an awesome program, or I might not like
>my new toy so much...

It's too early to give up. The key is using the right software. Once you do, you will think that trunking is no big deal compared to the virtual scanner flexibility you'll get with Probe.

No, I don't work for Probe.

I own both, and haven't found images on either. I personally like the BC895 better. This is mainly due to the fact that I can here my home town police department 50 miles away with the 895 and not with the 2042. Also, the BC895XLT supports CTCSS decoding, trunk tracking and has a computer interface built in (which I admit doesn't do anything too cool).

Rich Wells has great info on these scanners and many more on his web site:
http://www.qsl.net/n2mca/RADIO.HTM

I have a Relm HS-200. It works great. Take a look at this guy's web
page. He has a list of scanners he has reviewed. I consider good (loud)
audio to be important and good sensitivity to also be important for rail
scanning.

Without question the HS-200 is the better choice. I have an HS-200 that I use exclusively for trackside monitoring. My buddy has a Sportcat. We recently spent the day railfaning and compared the two scanners. My HS-200 won the contest hands-down. The HS-200 is louder and received far away trains much clearer than the Sportcat. In fact, there were times when the HS-200 picked up clear signals that the Sportcat did not. We both had the same type of antenna (Diamond) so that was not an issue. I would say go for the HS-200!

3876. Re: Help! I need USA Low Power Frequencies

Newsgroup: rec.radio.scanner
Date: 1998-05-06 00:00:00 UTC

Well, I havent seen any commercial grade radios that typically operate in
that band. I'm assuming maybe Motorola or someone makes radios for the govt
which operate there. Im not sure if this will help, but it does specify
the kHz steps, which should give you any of where to search. Scanning 20mhz
worth of bandwidth should be pretty easy (assuming you have a decent amount
of traffic)

400.000 - 406.000 US Govt - Meteorological / Space
[404.370] Wind Profiler radar |
[406.025] Emergency Locator Transmitter (ELT) |
406.100 - 420.000 US Govt - land mobile (12.5/25 kHz steps)

I'm not even sure there are individual common frequencies used in this band.

Keith

e-mail me with model, appearance, and all known problems/symptoms.
I will buy any broken programmable scanner.
Price depends on apearance, symptoms and age.

Not interested in crystal controlled scanners, except very small
handhelds or pager type receivers.

3880. PCR-1000 blown up by Visual Basic 5 ???

Newsgroup: rec.radio.scanner
Date: 1998-05-07 00:00:00 UTC
From: Miguel Puchol <mpuchol@eurohubner.com>
Message-ID: <3551CF31.3EEF9BB1@eurohubner.com>
Source record: 161109

Hi,

I am trying to write an application for my PCR-1000 with Visual Basic (I found the command instructions set on the net), and this is the third time it blows up (well, not literally).
The guy at Icom service center fixed it for free under warranty the first time, although he said it was a 'strange' fault. The board at the back of the unit had some components (he didn't specify) gone south, which caused the VCO to not sync.
The whole board was replaced for a new one.

The symptoms of this (in the software) are a constantly present signal, and the AFC indicator always pointing left or right, but never center. If you activate the AFC, the freq will change in whatever direction forever, plus reduced sensitivity.
The problem first appeared while I was writing the code in Visual Basic 5, and the second time it happened I was also using VB5 with my PCR app code.

Now I have just burned it a third time, while continuing to write this program, and I am afraid of what the guy at Icom will say, the second time he charged me one hour's work (about $80 worth).
The engineer at the Icom center said it was a problem with difference in potential between grounds (i.e. an a.c. ground loop or something like that) so I installed a dedicated earth with two ground spikes just for the PC and PCR-1000.

Has anyone experienced anything similar? I thought software could never damage hardware (i.e. viruses that cause computers to explode and so on), but now maybe this is true. Maybe I have a defective unit with some bad components somewhere else in the circuitry, I run out of ideas.

Regards, and please don't try this at home, you may blow your PCR up.

Mike

Above 400 MHZ, very serious gain can be achived easily. A 7-10Db yagi is small, easy to rotate and (a broadband one like a TV yagi on it's side) won't have a finicky narrow front lobe (not hard to aim, as a very long 14-17 db antenna would). It will pick up as much off the sides as any discone I've used and come close off the back. If you still wanted the discone in the circuit you could use a good 75 ohm UHF/VHF coupler (least loss) or a two-way splitter (least cost) to combine them. It depends what the discone does for you at

1000MHZ & up...
Also to consider: Omnidirectional gain is quite easy at UHF too. A simple 5 db gain UHF mobile antenna on a small ground plane (a bracket with some radial rods) will put a discone to shame. This won't cover the range of frequency a yagi can. Mounted on top it is omnidirectional. On the side of a pole or tower it will gain a bit off the free side and lose a bit toward the tower side. Higher gain is possible in an omni antenna, but it gets more expensive & narrower bandwidth as you go up..
I'm not a big discone fan. I've found them to be kind of equally mediocre on all frequencies, but my background is in servicing the mobiles & bases you listen to with a scanner, so I'm biased toward the wonderful effects of antenna gain...
I also have a question: Has anybody experimented with a bow-reflector antenna for UHF-800? I thought about putting 4 of them together (each facing 90 degress apart in a box configuration) for an omni with about 7 db gain at 450 and 9-10 db at 800 according to the engineering theory. It would be small & light & easy do on a tower (3 might even work, they are wide lobes!).

FOR SALE:

1 each Motorola Syncom-10 VHF/FM Transceiver, with operation and service manual. This is the type of radio used in public safety aircraft, i.e. Highway Patrol, Forest Service, Police, Search & Rescue, etc.

Features of the transceiver are listed below:

Fully synthesized receiver and transmitter

9598 frequencies, 2.5 kHZ spacing

Excellent receiver intermodulation and selectivity

All solid state

Independent, 2-channel guard receiver

Operates from 12 or 24 volts dc

No blower or external cooling required

Excellent receiver sensitivity

Price: $1000.00

Remember that the warrant must describe the place to be searched
(this can be an entire house) and the object to be searched for. An
officer with a warrant to search your house for a gun would NOT be
permitted to introduce evidence of drugs UNLESS the drugs were
in plain sight. Of course, when he left, it may be a good idea to
get rid of whatever contraband was there...

I need an updated database of freqs on CD-ROM and I'm thinking about getting ScannerBase. I tried the demo with 100 freqs per state and like the search engine. The thing I'd like to know is if the actual database they're using has been cleaned up. I used Percon for a while but found that it was riddled with mistakes of all kinds. I don't know if all they did was grab the FCC stuff and shove it on a CD-ROM or they rekeyed the info and in the process inserted the errors. Now, I'm wondering if the ScannerBase product is better or more of the same.

Thanks in advance for any replies.

I own a later model (MAy 1990) PRO-2006. The scanner works GREAT except while comparing it to a newer model (SEPT 93 and NOV 93 models) I noticed a subtle difference with my PRO-2006:

While in the search mode, my PRO-2006 seems to have a fixed squelch that activates only during search. While searching, if I open the PANEL SQUELCH all the way, the unit will not sound static, but continues to search. As a result, this "build in squelch" is set too tighly and allows the scanner to skip over the weaker signals. Also, it the signals are TOO strong, the unit either skips over them, or stop 5 Kc above the original signal.

As a result of this problem, I am not able to stop the search using the SQUELCH KNOB so that I can manually seach using the ARROW KEYS. I noticed the newer models I compared mine to stop searching when the SQUELCH is manually opened.

My question: Is this in fact the original characteristics of this older (and possibly the first run of 2006????) PRO-2006 and could have been changed later? OR, is there something wrong with my PRO-2006? Is there a resistor I can clip to disable this squelch that seems to override the manual squelch ONLY DURING SEARCHING.

This has always been the deal with this particular unit.

Thanks,
-Willy

Cathy introduced me to the PRO-64 deal too. Called around, and many stores had it for the $150. Excellent deal, considering all its features.

Hi Jeff,

I bought an ampl'fd spkr at RS also i have heard of a mod where the resistor
which is in series with the spk jk is bypassed. i don't know how much work
this is but i think I found it on compuserve's hamnet under scanner forum

Hi,

I've just completed an update for ARC build 3 (AR8000 Remote Control).

It will fix some problems in the build 3 version.

Download the update at:

http://www.geocities.com/SiliconValley/Horizon/9163/updat.html

Regards,

Gommert

Complete and in box. See link below for picture.

The Bearcat BC 3000 XLT Scanner Radio is a 400 channel hand-held receiver. Coverage is from 25 MHz to 1.3 GHz (less 550 MHz and 760 MHz). It has a triple conversion receiver. The scanner has 20 banks, 10 priority channels, frequency transfer, automatic store and automatic sorting. It features a Twin Turbo Search & Scan (scans 100 channels per second or 300 steps per second when searching), channel lockout key, weather search, data skip feature, selectable antenna attenuator as well as selectable mode. (Can set AM, FM or WFM on any frequency). The scanner also has a rechargable battery and wall adaptor.

Here's what I found on the one I think you're talking about....

PRO-27
(200-0108) Specifications Faxback Doc. #
39657

CHANNELS OF OPERATION: Two, determined by the two crystals operating in
the frequency range

FREQUENCY RANGE: 144 TO 174 MHz, 450 to 470 MHz, 470 to 512 MHz

FREQUENCY COVERAGE: VHF HI
8 MHz for maximum sensitivity (153 MHz +/-4 MHz)
UHF
30 MHz for maximum sensitivity (465 MHz +/-15 MHz)

SENSITIVITY: Better than 1.5 microV for (S + N)/N = 20 dB

MODULATION ACCEPTANCE: +/-5 kHz

I.F.: 10.7 MHz and 455 kHz

FILTERS: 10.7 MHz Ceramic Filter and 455 kHz Ceramic Filter

SQUELCH SENSITIVITY: Variable from less than 1 microV at threshold

AUDIO POWER: 200 mW max.

POWER REQUIREMENTS: 9-volt battery (Radio Shack Cat. No. 23-553 or
23-583)

Current drain: 25 mA (squelched), 100 mA (full volume unsquelched)

SEMICONDUCTORS: Two Integrated Circuits 8 silicon Transistors, 2 Diode

SPEAKER 1 3/4 inch (4.5 cm). 32 ohm Permanent Magnet, dynamic type

ANTENNA: Flexible screw-in type (rubber ducky)

CRYSTAL REQUIREMENTS: Standard HC-25.U 3rd overtone

MEASUREMENT: 4 3/4" X 2 13/16" x 1 1/16" (12.0 x 7.1 x 2.7 cm HWD)

WEIGHT: 0.4 lb (180 g)

(LB/km-05/20/1997)

I have one, I'll see if I can dig up the part no. It was a 2channel
crystal controlled reciever...
If my township ever moves freq, I'd be glad to part with it...but not
till then ..
I use it as a dedicated reciever during storms and such, so I can keep
an ear on surrounding activity while not missing dispatch at all.

3915. Legal Question about selling Scanners

Newsgroup: rec.radio.scanner
Date: 1998-05-07 00:00:00 UTC
From: Bob Schwerdtman <Bob9000@concentric.net>
Message-ID: <355272DC.6EBF@concentric.net>
Source record: 161144
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I need a definate answer to a question about selling scanners in the US
that were aquired from overseas. If a fellow recieved a UBC9000 as part
of a trade deal and then tried to sell it on an auction service like
ebay, is that legal? Is it against the law to sell one? If it is would
it be because of the cellular or because it is from another country?
Is it even legal for me to own it anymore? I have been getting
threatening E-mails from Byron Engler Bengler.bie@bie.ispi.net and he
says I can do some stiff jail time for this as well as have tons of high
fines etc. As a precaution, I did not sell it to the high bidder and
will just keep it but I would like to know what the exact law is? He
said he has forwarded coppies of the people that bid and that should be
enogh to get me in serious trouble. I am a law abiding citizen and would
hate to get in trouble over this
Thanks
BOB

3916. Scanner Questionaire

Newsgroup: rec.radio.scanner
Date: 1998-05-07 00:00:00 UTC
From: "David M. Hitchner" <NoOne@NoWhere.net>
Message-ID: <6its9d$fr5@bgtnsc01.worldnet.att.net>
Source record: 161145

I have a suggestion. Because of the many very vague request for recommending a scanner, someone should place a questionnaire on a web page that allows a person to fill in their requirements for a scanner then post the it on the news group. This way, the many experts in this group could provide more useful information. If someone already has a page, please post so new users can be referred to that page. If no one else wants to tackle this, I may put it on my page.

A couple of thoughts on what this page should include:

* Link to Bob Parnass's scanner articles that he post periodically (with Bob's permission).
* Types of frequencies the person wants to listen to.
* Acceptable price range.
* Info on what causes an increase in price (ex: scanners covering Mil Air usually increases price).
* Links to manufacture's web sites (without bias, also everyone has their own personal preferences).

Any thoughts?

Over the years, the audio output from my BC-250 has gotten lower and lower and lower. Now, the volume is almost gone. Anyone else had this experience and found a solution?

Thanks.

Bob,

There is some dispute as to whether or not the ban on the
manufacture and /or sale of cellular capable scanners as a result of the
ECPA makes illegal their resale by their owner. Some point to the old 5 Watt
CB ban as suggesting that they may not be sold or transferred. As an
attorney, I rather doubt that the FCC could ever get interested enough in
such a private one time sale transaction to press the local U.S. Attorney to
prosecute the matter; even if they did think it was in violation of the law.
If they did, I feel the local U.S. Attorney would have bigger fish to fry
and would ignore it, but this is no guarantee. These units are offered for
sale on these news groups on a regualr basis. But, if even this unlikely
possibility unnerves you, just don't advertise it for sale. It is clearly
NOT illegal to own, just illegal to listen to cell calls.What I would NOT
worry about is this other fellow being able to persuade any authority to
take any action. Do not lose any sleep over this kind of nonsense, either
the sale or ownership issues.

I am wanting to install the OS535 in my pro 2042, I would like any input for what might be the best software program to use. I have heard you guys talk alot about different ones. Here is my definition of best software.
1. User freindly ,
2. Easy install
3. Attractive, MODERN, appearence
4. A good Price. not $100-$200 but not super cheapo either.
Thanks in advance for the great response I am sure you will give me.
and as well for all the negative bullshit remarks That will follow along too.

don't waste your money on any other software, like I did, for the os456. when you start using Probe you'll not be using the others. If you really scan seriously you'll love probe.

We just finished upgrading our site so please check it out. We have a huge list of frequencies for Ontario but we will be adding ones for other provinces very soon! We also have various scanner codes for the RCMP, OPP most of the Common Codes and more. If Fast Food listening is your fancy, we have a huge list of Fast Food Freq.'s. Plus MUCH MUCH more!!

It's no wonder we were rated 95% from the WWW Review Page!

Visit our NEW & IMPROVED site TODAY!

Hello All,

I am looking for some radio frequencys for Portland Oregon. I would like to know if anyone know on what channels the News Helicopters for portland use on... Like Sky 8, Jet Ranger 1 and 2, New Chopper 6 and Oregons Air 12. If you know any of these icq me at 4568377 or e-mail me at shambles@spiritone.com or boeing_767@hotmail.com .

Thanx Every One

> > There are dozens possible......

> Share some of the modifications then.
> I don't care about cellular.

Good. Cellular isn't possible.

But how's about taking a little effort to
help yourself instead of imposing the onus
on me.

Tell me WHAT mod(s) you want to do; how equipped
and capable you are to do them; and how serious
you are.

In other words, convince me that my efforts
won't be a waste of time.

I do have to warn you that gone are the days of
simple "add-a-resistor" or "clip-a-diode" mods that
can be explained in a simple ASCII text paragraph.

"Mods" aren't that easy or simplistic anymore.
That's one good reason why I don't want to waste
my time if you're only "window shopping".

Show me some spirit; some zest; some willingness
to help yourself.....instead of panhandling me
to just "cough up".

Ahhhhhhhh, but THEY have!!!!! Several years ago,
as a matter of fact......

> Can that data be decoded with a standard opamp interface
> or with a soundblaster card?

Well, that opamp interface is not really a decoder.
Neither is the SoundBlaster. They're just instrumental
to the software that does the decoding.

But anyway, several years ago, a fellow concocted
what became known as the DDI (Digital Data Interpreter),
an interface and software that decoded the cellular
control channels and keyed another radio to follow
the handoff. I think the guy used Icom R-7100's...

But the federales got to nipping at his heels and
he bailed out of that end of the business.

Wait, Blake,.....I can't take any credit.
I just slapped ol' What'sHisFace on my Shit
List when he wouldn't accept my proposal, and
I've seen nothing of him since. Kill-filters
are a modern-day panacea, I'll tell ya what!

Seeing nothing gives me no reason to create
a disturbance....so it's a matter of leaving
well enough alone. Which I am pleased to do
so long as most of us are playing to the same
sheet of music.

I don't "see" him. Apparently he doesn't "see"
me, so all is well, so long as he doesn't
take up his old ways. Far be it from me to
ripple the waters.

If he's leaving well enough alone, then more
power to 'im and to the newsgroup. Suits me.

:-)

How did you install an external speaker port? I;ve tried plugging
external speakers into the headphone jack, but as you've noted, they are
no better than the internal speaker. I would like to be able to
increase the volume output somehow.

Any help appreciated.

3941. Scanner antenna discone and/or directional?

Newsgroup: rec.radio.scanner
Date: 1998-05-07 00:00:00 UTC
From: derickam@aol.com
Message-ID: <1998050705361500.BAA12614@ladder03.news.aol.com>
Source record: 161181

Hello,

I have been using a RS discone antenna for the past year for my scanning activities. I am happy with it, but I would like to know if there is any merit to directional antennas above 400 mhz? Do they increase performace enough to justify the cost/effort? My omni currently is mounted on a 30ft tower.

If you have had any experience with both types, I would like to know how you fared and if you would do it again. I have read that an approach is to use 2 antennas, one directional and one omni. The omni picks up the traffic and then the directional is moved for the best signal. Is this correct? if so, can they be used on the same line or must they be switched in and out of the antenna line?

Thanks in advance, I also would like to thank everyone who recommended a programming language for controlling scanners. I got a few flames for the subject title, but on the whole the advice was, I believe, sound and work has begun in Visual basic.

Thanks,

derick

> Can anyone tell me if there is a pot in a Pro 2022 for adjusting
> receive? Have like new unit with poor receive.

Call (800) 442-2425 and see if you can get a
service manual for the PRO-2022. You're sunk
and dead in the water without it because there
are a number of "adjustments" that affect the
receive quality. And any one improperly tweaked
can sink you deeper.

I'll hasten to add that even with a service
manual, you'll need the proper equipment and
a bit of know-how in order to have a remote
hope of success.

> Also, any cellular mods for Pro 2042?

None. Well....you can get a European version of
the Logic/CPU Board and replace the USA version with
it for a half-assed cellular performance (12 kHz
increments), but that is expensive.

If you are ballsy and fearless, you can replace
the USA CPU chip with the European version for a lower
cost than replacing out the boards...for the same
half-assed result.

In a word, cellular is not feasible in any USA
scanner made after March, 1994.

I am going to buy a scanner for my main radio as a base. There are so many nice scanners that I'm having a difficult time choosing. Please give me your opinions on which is the best scanner for the money. Please keep it under $400 and be specific about why you choose the radio. You can email me if you like. There certainly are lots of scanners to choose from! So far I lean towards the BC 9000xlt and 895xlt. Also, how important is CTCSS?

Thanks!

Hmmm. I've heard (from a reliable source) that the 2-resistor mod to enable
cellular works on the Icom IC-R10. Of course, it _is_ surface mount technology.

> "Mods" aren't that easy or simplistic anymore.
> That's one good reason why I don't want to waste
> my time if you're only "window shopping".

Actually, I did a rather nice and easy one to bring out the discriminator
on a SC-150 using the standard headphone jack.

Different RS has different comission policies ??

So (10% comission ?) if someone sells $5 battery, he gets only 50
cents but if he sells $2000 computer, he gets $200 ??

Ok I'll buy that the physical altering of the radio may be
a violation of the law..... but since when did free speech?
discussing radio modification would be similar to discussing
methods of murder lets say..... the deed is a crime the
discussion is not..... unless its about someone specific.

3953. R.S. Pro-51 FOr Sale (Date Code 1A6): Gets the images really well!!!

Newsgroup: rec.radio.scanner
Date: 1998-05-07 00:00:00 UTC
From: radioman@localnet.com
Message-ID: <6is906qde1@news7.ispnews.com>
Source record: 161193
Cross-posted to: rec.radio.swap,alt.radio.scanner,rec.radio.scanner

I have for sale the following unit:
1 Radio Shack Pro-51 Scanner. 200 memory channels. Very clean. Comes with original box, packing material, antenna, manual, belt clip and ni-cads that are 6 months old. (Charger NOT included, use that for my Pro-46 & Pro-43) Covers the following frequencies: 29 - 54 MHZ; 108- 136.975MHZ; 137 - 174MHZ; 806 - 823.9375MHZ; 851- 868.9375MHZ; & 896.1125 - 956MHZ. You'll note the cell blocks. However, the unit is still famous for getting the forbidden cell band images between 896.1125 and upward into the 900's. The images come in clear as a bell when I tried them. Remember, I believe the images are just as illegal to listen to as the real cellular frequencies.
Reason for selling: Just getting back into 2 meter ham after a several year hiatus. Need the cash to purchase a HH unit that I am interested in.
I am asking $125.00 Firm and I'll pay the UPS ground charges anywhere within the continental U.S.A. The only stipulation being that i need the funds in either certified check OR a money order.
Thanks and have a nice day

I'll be going to Algonquin Park in Ontario, Canada on vacation soon, and I was wondering if anyone had any frequencies that could be listened to while in the park.

Any help would be appreciated.

Thanks
Mike

Hello all,

I have a couple of old scanners that I need some crystals for. If
you have any of these to sell, trade, or give away let me know...
E-Mail me if you want to trade and I'll send you my list.
Thanks.

If anyone has or can help me find any of thise equipment please let me know...

A few years ago I worked at a radio station and remember that the station had a small receiver, about the width and thickness of a cigarette box and a bit taller. It took two crystals and I beleive it had a wire or something like that for an antenna (I may be wrong - may have had a collapsable antenna). I beleive that it was blue and may have come from Radio Shack. Does anyone remember this device, and possibly knows anyone or where I could find one?

I have a couple of old scanners that I need some crystals for. If you have any of these to sell, trade, or give away let me know... E-Mail me if you want to trade and I'll send you my list. Thanks.

Another point of view:

Winradio is IN the computer = good (no power supply or external cable,
nobody can see you have a police scanner inside your PC)

PCR1000 is OUT of the computer = not so good (messy desk, slow
scanning rate)

:-)

From what I've been able to tell (from Rich Well's website), the -91
is rather inferior to the -90. It has half the channels, questionable
service-search programming, and the RF performance vis-a-vis images and
such is noticably worse...

Bill,

I've been to Aruba a few times, and I can tell you they won't let you bring a scanner in the country, it's a definite no-no. The language is Dutch with a local dialect, but English is also spoken widely. Now shortwave radio, no problem bringing it with you.

Have a great time in Aruba, and as the locals say- "Proost!".

> the PC and PCR-1000.

My guess is that this, not your program, is causing your trouble. You might want to turn on the PCR-1000 and the PC, without connecting them, and use a good DMM to measure the difference in voltages between the cases. I'll bet you have one and a significant one at that.

Possible causes:
- using a non-isolated power supply for the PCR-1000, i.e. a ham supply which has one side grounded
- leakage current from your PC
- leakage current through the ICOM supply

The last two are easy to check as well -- use that same DMM (or a VOM, as long as it isn't the complete RS bottom-of-barrel quality) to measure between the PC case and ground and the ICOM case and ground. If your PC or ICOM supply is the culprit, it's also a safety hazard and should be repaired or replaced.

Good luck!

I've had my opto for about 2 years and have tried every available demo. PROBE is the absolute best software available. It is a DOS based, no-nonsense program that is easy to install and use. I would not think of using anything else at this point, it has all the features any scanner hobbiest could hope for!

My workaround has been to NOT program all ten priority channels, just two, the local PD and FD. I have 5 other scanners that only have a single priority channel, so limiting it to only two is still more than I can get with the others.

Allen

About the software for the IC-PCR1000

I would like to have software to import (or open) *.MCH files with the
possibility to sort the channels.
Something to easy change the *.MCH files and write them back to be used
with the PCR1000 (a extern program)

3980. What is a discriminator

Newsgroup: rec.radio.scanner
Date: 1998-05-08 00:00:00 UTC
From: Chris <**e@connix.com>
Message-ID: <3553624C.5B0606C0@connix.com>
Source record: 161020
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Excuse my simple mindness but what is a discriminator? I have a BD895XLT and wonder if it has a discriminator. All I know that it is some output connection.

Thanks

3981. Virginia Beach freqs- anyone have?

Newsgroup: rec.radio.scanner

Does anyone have a current listing of Virginia Beach, Virginia
police/fire frequencies? I've got a list, but it is rather dated.

Thanks.

HI Bill,

I too have a BC7. Appreciate someone finally answering this
same question for me. I follow this newsgroup constantly and
I along with many others appreciate all the help you give out
to this great hobby.

Regards,
Eric Meyers

Go to Aruba, chill out and leave the stinking radio at home, whether they
allow you to bring it in or not! Life is too short!

Not unless the dude is writing to eeprom and maybe corrupting the code
needed to properly boot up the logic board, and consequently affecting
alignment parameters for front end filters, etc. (that would be contained
in the eeprom). Ever disconnect a flash eeprom during code download ?
You'll render the device it's controlling inert real quick.

However, I agree with the other poster, my money is on some funky
ground problem....little knowledge being a bad thing. Should have
jsut hooked everything up with standard 3 prong plugs, and not made
everything overly complicated with extra ground wires, etc.....

Simpler is better sometimes.

3986. PCR1000 Command Set

Newsgroup: rec.radio.scanner
Date: 1998-05-08 00:00:00 UTC
From: kf5oj@iamerica.net
Message-ID: <35538400.3491440@news.iamerica.net>
Source record: 161026

PCR1000 Command Set:

All commands are sent is ASCII in the format: Command + CR + LF
CR = chr$(13)
LF = chr$(10)

Some responses from the PCR1000 have an added character at the end
of the response string. It is usually a duplicate of the last
character of the string and can be discarded. (A bug, I suppose)

DTR and RTS set high by software.

When radio is first turned on, the software send the following
commands:
initial boot up at 9600 Baud.

H101 Turn Radio ON
G105 Set Baud rate to 38400 Baud
G300 Set Autoupdate to OFF
H1? Is radio still ON? Responds H100 for OFF, H101 for ON
H101 Radio ON command
G4? Possible Inquire Country Code. US version returns G410
G301 Auto Update ON
GE? Not Known but returns GE09 in US version
GD? Is DSP Installed? Returns GD00 if NO, GD01 if Yes
K00857937500050200 Set Frequency
J4100 Set Squelch
J5100 See Tone squelch
J5000 Set VSC off

I1ss ss is Signal Strength 00 to FF
I200 Signal Frequency < Display Frequency
I280 Signal Frequency = Display Frequency
I2FF Signal Frequency > Display Frequency
I300 No DTMF Present
I31t t is DTMF tone (* = E, # = F)

Baud Rate
G1xx
where xx is:
00 = 300
01 = 1200
02 = 4800
03 = 9600
04 = 19200
05 = 38400

Signal Update
G3xx
00 = off (Program needs to inquire signal strength, DTMF tone, Center,

etc)
01 = on (Radio sends signal strength, DTMF tone, etc as needed)
02 = binary mode (Update off)
03 = binary mode (Update on)

Icom PCR1000 Band Scope commands.

The basic command to turn the bandscope function On is:

ME00001200501000125 00 + CR + LF

The command breaks down this way:

ME00001 20050100012500
ME00001 is the preamble. It's always the same.

ME00001 20 050100012500
20 is the number of samples. It must be a 2 digit HEX number
represented in ASCII. Add leading 0 if necessary. Calculate
this number by dividing the Scope Bandwidth by the step size. For
example in the +- 200 Khz span the total bandwidth is 400 Khz. If the
step size is 12.5 khz then 400/12.5 is 32 or 20 Hex. If you get a non
integer answer for the initial division then increment the sample
number by 1 or 2 (sample should be an EVEN number). You can
arbitrarily set the sample higher(SLIGHTLY) to allow the display to
be moved inward from the edges of the scope display.

ME0000120 05 0100012500
05 is a sample rate value that detiremines how fast the
scope is swept and in the Icom software is either 05 or 28. This is
interpreted as a hex number and must be 2 digits. The practical
values
for this runs from 01 (very fast and resource intensive) to about
70 (very slow and nearly useless). Putting 00 here locks the PCR1000
and software up. In the Icom software the number of samples
detiremine this value. Sample numbers above 10 hex use 05 and those
10 Hex or lower use 28 Hex.

ME000012005 01 00012500
01 This is the On/Off characters. If they are 00 then
the bandscope is OFF. If they are 01 the bandscope is ON

ME00001200501 00 012500
00 is a padding value and must be there.

ME0000120050100 012500
012500 is the step size expressed in HERTZ. It must
be 6 digits long, padded with LEADING ZEROS. Examples are 001000 for
1000 hertz (1 Khz), 030000 for 30 Khz and 100000 for 100 Khz. The
bandscope accepts values down to at least 10 hertz but the Icom
software displays a LIMIT warning at 1 Khz and at 100 Khz.

The Band Scope commands appear to be insensitive to mode and bandwidth
except for the fact that it doesn't work in USB, LSB or CW. It has
been hypothesized that the product detector circuitry is used by the
Band Scope.

Typical Band Scope Commands:

ME00001C8050100001000 +- 100 Khz @ 1 Khz
ME0000164050100001000 +- 50
ME0000132050100001000 +- 25

ME00001A0050100002500 +- 200 Khz @ 2.5 Khz
ME0000150050100002500 +- 100

ME00001002801001000000 +- 100 Invalid
ME00001002801001000000 +- 50 Invalid

****

The data is returned in 37 byte packets. The packets begin with the
Letters NE1 followed by the 2 digit hex packet number. The Packet
numbers run from 00 to F0 (must be 2 digits). Typical packet numbers
would be NE100, NE170, NE180 and NE1F0.
These numbers are followed by 32 bytes that contain signal level
information for EACH sample (16 per packet).

Each byte is a hex number (in ascii) that can run from 00 to FF. The
bytes in packet NE180 represent the first 16 samples UP from the
displayed frequency in ascending order. The bytes in packet NE170
represent the 16 samples BELOW the displayed frequency in descending
order. For example the following:

NE18020202020202020202020202020202020

NE1 80 20202020202020202020202020202020
NE1 is the fixed preamble

NE1 80 20202020202020202020202020202020
80 is the packet number

NE180 20 20202020202020202020202020202020
20 is the sample signal level (20 Hex) at the displayed
frequency

NE18020 20 20202020202020202020202020202020
This is the next sample level UP from the displayed freq

The next 14 values represent the next 14 sample levels. If less
samples
are needed, the higher sample levels are set to 00. If more then 16
sanple levels are needed Up from the center freq, then the next packet
NE190 hold the values.

For the following:
NE17000000000000000001111111111111111

NE1 70000000000000000001111111111111111
NE1 is the fixed preamble

NE1 70 00000000000000000001111111111111111
70 is the packet number. Packet 70 is the first packet BELOW the
center frequency.

NE17000000000000000001111111111111111 11
11 This is the first sample level

BELOW the center frequency.

NE170000000000000000000111111111111 11 11
11 This is the next LOWER sample
level and so on. In this example, only 16 (10 Hex) samples were
specified. 8 samples are provided here below center freq and the
corresponding 8 above center freq would be in the NE180 packet.

If more then the 32 samples that can be displayed with NE170 and NE180
were specified then additional packets would be sent. For example if
48(decimal) samples were specified then the following packets would be

returned: NE160 would have 8 samples (in the UPPER 8)
NE170 would have 16 samples
NE180 would have 16 samples
NE190 would have 8 samples (in the LOWER 8)

Note that they are sent in ascending order from NE160 to NE190.
A rough indication of the number of packets needed for a given sample
size is (Number of samples)/16 plus 1. If the number is ODD then add
1 more packet.

Sample in order sent (This is a continous string):
NE160000000000000000000000030180FA61F14
NE1701F2B0C0F7E030C2B85088E080F2B4314
NE1801B8E181830085FEC6603083001143003
NE190010301010127010000000000000000000

When Band Scope is first turned ON or is turned OFF, ALL 16 packets
are returned with ALL samples set to 00.

The DSP commands below have to be sent as a packet
followed by a Cr + Lf

sample packet

J8001J8101J820FJ8301
| | always there and never changes

J8001J8101J820FJ8301
| | DSP ON J8100 is DSP Off

J8001J8101J820FJ8301
| | ANR on and set to max would be J8200 if off

J8001J8101J820FJ8301
| | Notch turned ON J8301 turns notch ON

With this in mind here is the DSP Command Set:

On startup the software sends GD?
Returns GD00 if NO DSp installed
Returns GD01 if DSP Installed

Autoupdate must be ON (send G301 + cr + lf):

J8001 Always the same

J81xx where xx is 00 if DSP is OFF and 01 if ON

J82xx This is the ANR function (Automatic Noise Reduction)
xx is 00 if ANR is OFF. If ON, xx varies from 01 to 0F
when you turn a knob on the new DSP Popup panel.

J83xx is the Automatic Notch filter. xx is 00 if notch
is OFF and 01 if ON.

The following data is written to the PCR1000.ini file.

DSPON with either 0 or 1 for Off/On
DSPANF with either 0 or 1 for Off/On
DSPNR with either 0 or 1 for Off/On
DSPNRLEVEL with value 0 to 15 for Noise Reduction level

My apologies in advance for any typos

This is one extra fine scanner. I have sold a lot of stuff on
rec.radio.swap and rec.radio.scanner, and I honestly don't remember
calling something mint, or near mint. I am pretty tough about calling
things mint, but this one is as close as I have seen. Comes with
antenna, and AC adapter. (adapter was extra, did not come with scanner
originally...)

Best offer over takes it. (nothing under $125, please...)
I pay shipping to con. 48 states.

You created a new database. In version 2.1, the "Create new database"

does not work - it creates crap databases.

I will fix it with 2.2. But... I am currently working on getting my
Amateur Advanced license, so programming effort is moving slowly.

So, find an existing database, and copy it to a new filename (*.db,
*.px, * val files). Usnig file manager, simply select these three
existing database files, press F8 and type in a new name + .*
Example: newdb.*

> B. Is there a way in the software to filter out certain trunk ID's while
>leaving the ones I want active during the search of a trunk group? I would like
>do this with a database.

You cannot "FastScan" trunk ID's, just frequencies.

>This is great software and a lot of fun to use ! I'm still in the learning
>curve......

Due to crappy documentation on my part (I'm guilty as charged)

Search the web for a company called MX-COM and order their MX-128 inverter chip. Very easy to build. I've built a voice inverter already. Works great!

3996. Re: Scanner Questionaire

Newsgroup: rec.radio.scanner
Date: 1998-05-08 00:00:00 UTC
From: "David M. Hitchner" <NoOne@NoWhere.net>
Message-ID: <6j05im$o14@bgtnsc03.worldnet.att.net>
Source record: 161036

Maybe questionnaire was not the right word. I guess a feature checklist of desired features would be more appropriate. It would necessarily be a list of features that particulars scanners have, but a wish list of desired capabilities. For example:

```
-----------------------------------------------------
( ) Short-wave Bands. {Description of SW bands, benefits, affects on
cost of scanner, etc.}
( ) Ham Bands. ...
( ) AM Broadcast ...
( ) FM Broadcast ...
( ) TV Audio ...
( ) 800 MHz ...
( ) Trunking ...

Number of Channels
( ) 50 ( ) 100 ( ) 200 ...

Scanning Speed, Modes (CW, SSB, etc.)
-----------------------------------------------------
```

The person seeking help on deciding which scanner to purchase could then post the check list to the new group instead of asking "What scanner to I buy?".

Bob,

I've really enjoyed mine for the almost 3 years I've had it! Of course, I don't "scan" around with it much, just use it to listen to various ham, public service, and FM broadcast frequencies that I favor.

Perhaps more hard-core scanner folks would have some complaints about it but so far I have nothing bad to say about the one I have. Just make sure you get an extra battery so your listening/scanning won't have to be interrupted. I leave one on charge and use up the other, then swap them out. Takes me about 3 days to do that, with it "on" about 1 to 2 hours per day.

It's a little 2 Channel Crystal controlled reciever...it does not scan,
but needs to be switched from one freq to another.
I like it, uses a 9 volt Batt.
Typically, I leave a NOAA freq, and local dispatch in it, and leave it
in the drawer for true emergencies.

I can't really answer the question, but I do have the CD, and would be
glad to perform a search and attach the export file to an email to
you, for you to evaluate.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

What a dilemma! A co-worker called and said he wanted to borrow my scanner for a car race on May 31 and June 6. This guy's been real nice to me. He and his wife babysat for us, she came over and ran our garage sale while we (my wife, boy, and I) were on vacation, etc.

He E-mailed that he wants to borrow my Pro-39 w/cell mod for the races so he can listen to the drivers.

I got that Pro-39 w/cell mod in cold storage as back-up. My Pro-2032 w/cell mod is my primary. Use it every night. Using it right now.

This co-worker is doing better than I am at his job. I may end up working for him. He deserves it. He really is that good. I can't dispute that.

I should loan him this *irreplaceable* Pro-39.

I ain't gonna do it. That *irreplaceable* part bothers me.

I have no other choice than to buy him a scanner that will receive pro-race track driver frequencies.

WHAT'S THE CHEAPEST HAND-HELD SCANNER THAT WILL RECEIVE THESE RACE CAR DRIVER FREQUENCIES?

Good morning Tracker,
I just fininshed programing my scanner with Radio Shack's Beyond Police Call book, I don't know if you already have these freqs but here is what they list for Springfield:
154.770, 155.625, 460.100, 460.225, 460.300, 460.450, 460.500, 460.475, 460.500, 460.975, 465.100, 465.225, 465.300, 465.450, 465.475, 465.500, 465.975, 156.195, 158.985, 159.075, 155.280, 155.340, 462.950, 462.975, 463.175, 468.175.
I don't know if any of these will help but this is what I have. Good Luck!

Miguel,
I really have to question the ability of a command over the CIV/RS232 can do damage to your radio. What you are saying is Icom has programmed into their radio a self destruct command. Now if your interface is faulty that would be a different story. Are you using all Icom accessories?

Hello .

How wide freq.-coverage may I get on an IC-H16T (MRH 45 software , European) ?
And how do I expand the frequency-area as much as possible .

At the moment it covers from about 103 MHz to about 180 MHz TX , and from 136 MHz to 180 MHz RX (I have RX down to 103 MHz , but it don't demodulate AM) And it has 100 Channels .

If anybody know how I can change the freq-area in the "programming-mode" , please mail me instructions on what adresses I have to change , to get a wider freq-coverage . mail to : kdalsboe@online.no

Thanks in advance .

When will "I" let this die? Give me a break, retard. Don't try and push any blame on me when your life revolves around being an instigator.

I might let up on your sorry ass just a bit if you apologize publicly for your years of badgering and acknowledge that you have been a total failure in producing relevant posts as you were requested to all the way back to LAST YEAR.

If you refuse to apologize, then just post on-topic. Only post relevant posts. That should keep you out FOREVER as you've NEVER done it before.

I, on the other hand, DO post on topic. Just not under this ID, moron. How many times do I have to tell you that before it sinks in to that cement skull of yours?

Whereas you NEVER post on topic. EVER. Never have, never will. That's a fact. Your life involves throwing tantrums to get attention because you are a wannabe in the world of scanning and electronics. You don't have the cranial capacity to make it a reality.

If you insist on continuing your mental battle, piss off. You have officially become a waste of my time. You are beyond stupid. You are beyond help. You live a daily lie in your own pathetic world. I just want to know who you THINK you are fooling ?

I will give you 1 final warning. Keep it up and I will make it my crusade to get your ass booted from MCI just as fast as others got you booted from Sprint. Take it as a challenge if you want. Try me.

First check the external speaker jack for a dirty connection.

If that's ok, test/replace C81, a 100 uF 16 V electrolytic capacitor
in series with the output of audio amp IC4. C81 is located
in the corner of the printed circuit "radio" board.

If those steps don't fix your BC-250, check the other caps around IC4.
Could also be a bad volume pot, but C81 is the most likely culprit.

BC60XLT-1 will cover most of the cars. (450-470mHz) There are 2 NASCAR
teams (T. Bodine & M. Waltrip) and several IRL teams that run 800mHz
radios. A refurbed BC60 and RT40 track headphones from Uniden will set ya
back about $90 + ship. He could also rent a radio and headphones at the
track for about $35 (highly recommended), just look for the radio vendors
truck. (Racing Radios, Racing Electronics, Fan Scan etc.). The race track
environment is harsh, and is no place for a "prized" anything. Suggest
to him to rent one at the track, since your radio seems to be having
problems.....

Selling something illegal is illegal itself. Best bet is to sell it
secretly and get cash for it. Don't take a check or anything with your name
on it. After the sale, forget about it and deny ever seeing it if asked.
Good luck.

Remember that any item is considered in plain view if the police can see it from somewhere they have a right to be. For instance, if an officer has a warrant to search your house for a gun, he will likely be looking in drawers, etc. When he opens the drawer to look for the gun, and sees drugs and no gun, the drugs *are* admissible, as they were in plain view. The warrant that gave him the right to open the drawer is the key. If he had a warrant to look for a couch, and he opened the drawer to find drugs, the drugs would be inadmissible.

And some guys like fat gals while others like skinny
ones. Like beauty, "easy" is in the eye of the beholder.
There are guys right here on this newsgroup who get
fits of apoplexy at the thoughts of removing the
screws from their scanners.

Discriminator taps ARE easy from a procedural stance.
From a time and mechanical perspective, it's not
likely that a klutz would think it easy. To do it
"right", with a clean, reasonably professional look,
it would take at least an hour, and probably two.

I don't believe that classifies as "simplistic and
easy" when you're trying to honestly describe the job
to a crowd of a few hundred, where they range from
idiot and imbecile to grizzled, salty engineer......

To you and me....Discriminator taps are a piece of
cake. The next guy might turn his scanner into a

basket case..... hence the caveats and brutal honesty.

Good thing, then. Otherwise you'd blow your
right eardrum clean out the left ear.

If an earphone isn't good enough to hear
the scanner at a race, either the scanner is
defective, the earphone is defective, or
you're three-quarters deaf.

Amplification is not necessary for earphones,
except that headphone audio can be improved
sometimes by changing the series resistor that
feeds the phone jack. Cut its value by half
to 75%. If it's a 220-ohm resistor, replace
it with a 47-ohm resistor.

THAT is as good as it gets for headphones.

Bob,

I think that you have received some good feedback regarding the legality of selling scanners which cover cellular freqs. I have a feeling if you are in individual selling your own personal scanning equipment, and the scanner was legal at the time it was originally manufactured and sold new by the original retailer/distributor, then there is very little likelihood you would be prosecuted by FCC or local authorities for reselling it. If however, you take new scanners, which are cell blocked, and modify them so that they can receive cellular freqs, and re-sell them, that might get you in trouble. As you were told, if you are a private individual selling a couple scanners that were fully legal when manufactured several years ago, doubt you'd have a problem. I wouldn't however, buy a few dozen new cell-blocked scanners at your local Radio Shack, convert them for cellular reception and then advertise them for sale. That would probably buy you a little visit from the Friendly Comm Co. folks! As far as owning a scanner, or other communications equipment - its not illegal to own them, just to monitor cellular freqs, or in the case of transceivers, to transmit on freqs. for which you have no valid license. As far as cellular monitoring, some authority would have to catch you in the act of receiving these freqs and prove that you used such information in an illegal manner (for blackmailing, extortion, corporate theft, etc). Doubt many DA's in this country would want to spend the resources to prosecute someone just for monitoring cellular freqs. in the privacy of their own home, although as I understand the current federal law, this is now technically illegal.

Hi David...

Rich Wells's web site contains lots of info on many scanners.. including detailed specifications, user opinions and reviews. I'd recomend going there before making any scanner purchase.

I'm with you on that. And it already exists. Rich Wells and Bob Parnass maintain web sites with reviews, lists of features, and FAQs. (Apologies for not naming others who also maintain excellent sites.) It may not be in a 100% spoon-fed version, but it's all there and very clear.

One of the opening lines in the FAQs for this group is to not post a blanket "What scanner should I buy" question. A questionnaire would be an invitation for that, with all of its problems.

If you can find a Radio Shack that still has one, the PRO-64 is going for about $150. That's what I've got, and will be using there. I've been very happy with it. Make sure you get some good sound protector headphones. Those will run about $60 to $80 (RS does not have any), or you can make your own out of a set of industrial hearing protectors and some lighweight headphones or ear buds. I rolled my own for just under $15.

With 400 channels, you can program both the IRL Indianapolis 500 frequencies and the CART Gateway frequencies. You are going to both, aren't you? :-)

Also enough room to plug in the track frequencies for Anderson, IRP and the Fairgrounds. I assume you'll be spending your evenings at those, too. :-)

Not a chance of "unblocking" any freqs. You
can't unblock what ain't blocked in the first
place. Bands like cellular and mil-air simply
are not there, period.

Dozens of other mods are possible, but nothing's
possible without a service manual. Get me one,
and I'll be happy to look it over.

Why don't you try the software kind?

INVERT.ZIP 96252 03/11/1998 14:40 Speech inversion decoder

ftp://204.210.11.204/intrface/invert.zip

However, if the Ramsey inverter didn't work,
nothing else is likely to. You might not be
dealing with speech inversion.

Regardless of what anyone else tells you, your
only recourse for a "definite" answer is to
consult with an attorney. No one on this
newsgroups is qualified or legally empowered
to give you legal advice, and if they do, their
responses are not legally binding on the law...

....and might well get you in the deep, dark shits.

> the ScannerBase product is better or more of the same.

Are you nuts? If the FCC can't correct the errors in
its millions of records, why on earth would a vendor
selling a CD-ROM for $30 or so bother to even try?
How is the vendor to know what's an error and what
isn't? The ultimate authority on these records is
the FCC, so no one else can legitimately attempt
to clean them up en masse.

Sure, you as a user might well spot errors in the
records of your locality. How the heck is a vendor
1000 miles away supposed to be able to do that?

Here's a tip for ya, pal. CD-ROM frequency databases
are not error-free, and for the most part, come
straight from the FCC's data, regardless of the
name on the label. The database engines on the CD's
will differ, as will the query and search functions,
so you should buy on that basis - NOT on the quality
of the records, which no one but the FCC can correct
or amend.

As for ScannerBase, it's okay. The ScannerBase people
are kind of paranoid about users stealing their data,
so there are a lot of built in restrictions on what you
can do from the database engine.

I suspect the leader PERCON has the better deals, but
what the heck.....$30 ain't going to kill you.

I believe that listening is what is prohibited and the intent part is immaterial. After all, how could they prove that you were, say, listening to cell phones because you hoped to grab credit card information? Eavesdropping on cell phone calls is against the law--it doesn't matter why you were doing it, I would guess. But, heck, I'm not a lawyer...

CTCSS isn't vital. Besides, you can add it later
to any scanner.

What you do need to know is that Uniden Scanners
all have a lot of sizzle and not so much steak.
But their front panels and internal firmware are
something to behold.

Consider the PRO-2042 from Radio Shack. There's
a scanner with sizzle, steak, and lugnuts.

The folks on the Island of Aruba speak a language called "Papiamento"
(Don't hold me to the spelling, but that is what it is called)

Yes, it is a local dialect, and a mix of dutch and spanish.

I brought a scanner to Aruba once and was disappointed...the majority
of the comms are in this language, and mostly taxi cabs, PD and
fire...

I did listen to the airport tower comms which are minimal, as it is
NOT a very busy airport at all.

I would leave the scanner home and enjoy this most beautiful island.

Dan

Also consider that it is on sale in many places for $299, which makes it a very good buy. I've been told that it is about to be discontinued, but I don't know that first-hand.

I'm retracting my above question until after further experimentation.
This is my first scanner and I don't yet understand the logic behind it's
priority function. I did observe this: I plugged in inactive freqs. in
priority channels 1 thru 9 and the weather ch. in pri. ch. 10. Press
<SCAN> to scan bank #1. It takes 20 seconds to discover the weather on
pri. ch. 10 Press <SCAN> to return to scanning bank #1. Now it only
takes 2 seconds to grab pri. ch. 10. It seems that the scanner first
checks on only one pri. ch. every 2 seconds until it checks all ten pri.
channels, after which it checks either the last active pri. ch. or all 10
pri. channels????? I hope this makes atleast some sense, it has been a
long week, and me with newbie status and all.... Maybe someone can
explain what seems like ass-backwards logic, or maybe it's me that's
ass-backwards, in which case I need a beer. gotta go now. Thanks for
any help.

Tracy

Depends. The helos still hang out on Tac 1 (154.83) unless attached to
an incident - then they tend to operate simplex on the output of whatever
channel is being used for the incident.

For now, the helicopters "guard" Tac 1 all the time, even when on an assignment working one of the UHF "Astro" freqs. They are slowly moving to a new UHF freq, but old habits die hard. Special groups like Air Suport, METRO, and such and are used to using 154.83 like an intercom. Tac 1 is normally group selected by the RTO's for a Hot Shot call in any Bureau or Division.

4074. Can digital 800 Mhz cellular phones be cloned?

Newsgroup: rec.radio.scanner
Date: 1998-05-09 00:00:00 UTC
From: barryng@ibm.net
Message-ID: <6j0h26nor1@nnrp1.dejanews.com>
Source record: 160957

I currently pay for two cellular telephone services. One uses a permanently mounted Motorola digital phone in my car and the other uses a Nokia 2120 digital handheld. For various reasons I want to keep the permanently mounted phone in my car but still need to maintain the portability of the handheld. Since I pay for every minute of airtime I do not believe that the service provider should care what hardware I am using. Therefore I want to clone the two phones so I have only one service and one number. Can digital phones be cloned? I am told they cannot. Frankly I do not care if AT&T or Bell South sanctions this or not. They are being paid for the airtime so I intend to clone the phones if it can be done. I have asked both providers if they can give me service using the same number for both phones. One will not and the other charges absurd/insulting fees for the second phone. So much for trying to do this by working with the provider. Any help or advice would be appreciated. Thank you in advance.

Many states exempt licensed hams from scanner bans- a pretty good incentive for getting a ham license- which is pretty easy to do these days with the new no-code thing.

Dual conversion scanner. Are you looking at one? Why aren't you reaching for your wallet? This scanner sold for about $200 new. This scanner is cell mod capable while receiving favorable steps through that band. There is information published that indicates that some Pro-39's were manufactured with safeguards against opening up the 800 band. (I think it was epoxy over the chip (d-39?) you had to remove).

Characteristics are the exceptional speaker, bassy clear sound that one would expect from a larger, base-type unit. Accoustics are good.

It's not triple conversion, the best would be a Pro-43 with a date code prior to April of 94, but the Pro-39 is a capable radio. Nothing to sneeze at. Don't walk by one at a Pawn Shop or swap meet. Buy that puppy.

A discriminator is any member of the KKK or similar organization.

OK, bad joke. Actually, a discriminator (in a scanner) is a resonate transformer at the end the 455-Khz IF strip that converts the FM signal into audio. There are a few other types of FM detectors, but most scanners use discriminators because they work well with low deviation narrow-band FM.

> choosing. What else is available? Thats why I said any...Thank you.

Oh. Well, mods are rarely "available". At least
I don't know what you mean by that question. It's
not like you can traipse down to the goody store
and shop around for this mod or that mod and dicker
for the bells and whistles.

Ohhhh, I suppose it can be if you want to hire
someone to do the work for you. But presumably
that's not what you're after. If I read between
the lines correctly, you want someone to engineer
the mods FOR you and then tell you exactly what
to do.

But it doesn't work that way exactly..... Aw, I
guess the simple stuff can....but the trouble is
that the simple stuff is a product of a bygone age.
You don't clip-a-resistor or add-a-diode that can
be explained in so many words or less of plain ASCII
text like here in the newsgroups. Not any more.

Times where when there were a few scanners that had
some latent capability that could be extracted in
five minutes from a 100-word newsgroup post. But
not anymore. At least, not often.....

I have, however, published several mods for the PRO-26
in recent back issues of Monitoring Times and the monthly
World Scanner Report. Those articles, including a
back light mod are copyrighted and have to be treated
as such.....meaning, you can buy the selected issues
for a nominal cost.....in the $3 to $5 range.

The difference between quality articles like those
and the plain ASCII text articles you find on the public
messaging media is usually worth the price and more.

Best I can tell you based on your not very specific
question.

> that first-hand.

You're right! It is on sale here and there.
And that deep of a discount usually means
discontinuance. It's about time. The 2042
has been around for two years now and has
pretty much run its course.

Radio Schloque's catalog year starts in August,
but they often discontinue and introduce new
stuff in the May-June period. So we should keep
our eyes open for whatever is coming down the
pike.

Say, while I have your attention.....you will recall
the PRO-2041 and PRO-64.....computer programmable.
Well, they've been discontinued, too. But....I got
a hold of the programming manual for them....and guess
what? That manual covers a level of control and data
acquisition that the 2041 and 64 weren't capable of!

The implication from that detailed manual is that
GRE-Japan has a slew of radios on the books that will
all adhere to a common programming standard, some of
which appear to be real powerhouses.....like nothing
in Radio Schloque's inventory to date.

The inference is that some cool stuff is coming down!

"Pocat" <pocat@myriad.net> wrote:

> Please excuse my ignorance.

> What are Discriminator taps

Ignorance always precedes enlightenment. So
don't sweat it. Be thankful because ignorance
beats the snot out of stupidity any day. Let us
now proceed to enlightenment!

FROM MY REGULAR ARICLE: "Discriminator Outputs in Scanners"

There is a growing interest in tapping the baseband audio
out of various scanners for decoding of a variety of esoteric
signals, including CTCSS, SCA, FSK, RTTY, FAX, etc. By and
large, such signals cannot be taken from TAPE REC jacks,
headphone jacks, and EXT SPEAKER jacks because of the voice-band
filtering that is done between the signal source and these
output jacks.

Therefore, it is necessary to tap the "baseband audio" directly
at the output of the discriminator chip for your scanner.

That's it in a nutshell. Basically, there are more and
more non-voice signals out there now, and a lot of 'em
are capable of being decoded and displayed on your
PC monitor. The Discriminator Tap is the first step
to decoding data from the airwaves.

Cool, eh?

Use a longer antenna. A 20-30 ft wire will do
wonders on the cordless phone band, compared
to the rubber duckie.

4087. Looking to trade for contiuous band scanner

Newsgroup: rec.radio.scanner
Date: 1998-05-09 00:00:00 UTC
From: cjf@meta3.net
Message-ID: <35541014.237916A7@meta3.net>
Source record: 160970

Got some car stereo equip, a Psion palmtop computer, and a Uniden SC150B I'd like to trade for a good continuous band scanner with _no gaps_. Desktop is fine, prefer a cig lighter adapter with it. A portable would be great.

Stereo equipment:
*Two Orion XTR 15in subs in a custom box, dual voice coil 4 ohm, dust cones banged up, in good shape though.
*Pioneer P606 Premiere tape deck head unit (used, working order, not banged up) with remote. Got it in a trade, then got an Alpine CD, don't need this one now.
*The Psion is an older model (series 3) not particularly powerful, but comes with two PCMCIA game cards with lots of games(really neat golf game), and a leather case.
*The Sportcat is in decent shape, used by an EMS professional (me :P) for many years so it shows wear, still works perfect., use it every day (almost, we all need a break)and will continue to use it if no one is interested. Wall adapter and radio only, might be able to scare up the manual tho.
You can probably tell I don't know a lot about high end stuff, we mostly use Uniden workhorse type scanners (Wal-Mart specials) but I'm anxious to step up, so help a medic out with some info please. A friend turned me on to some Gov freqs that I can't get and the cops are using cell phones more and more, plus in my line of work I need a good unit. I'd like a really nice unit and I'm not afraid to pitch in a little cash so if you're interested at all mail me, I might have something else you're looking for. Or if you'd just like to recomend a primo scanner that I should keep an eye out for mail me. Thanks all.

BTW: This is an old SportCat, and ther's not an A in the serial (friend said that might mean it can be modified for cellular) He said something about being made before 1994 (I think) and congress making it impossible to modify them. *shrug* might mean something to you.

Hi
I've been researching getting a scanner and when asking about restoring
cellular to older scanners, I've been told : "Yes, but the
cellular works in 12.5 kHz steps, not the desired
30 kHz, so don't lick your chops or hold your breath." (3000xlt)

What does this mean, and more importantly, what scanners do the "right"
steps?

Thanks!

Bob

Source record: 160984

The Pro-91 is ALSO a TrunkTracker. It only has 150 channels. It also has a different set-up for the service scan. There have been complaints already that the service scan is "missing" alot of important freqs. The battery compartment in the 91 is a clamshell and will accept alkaline or NiMH or NiCad bateries.

In article <3553D619.1F79@gwis.com>, paul and jacki <jackid@gwis.com> writes:

Oh yes, now I follow...a "I need the following features, which scanner has 'em?" sorta checklist thing.

Or someone REALLY knowledgeable could create a chart as I mentioned above, say using Excel, with FEATURES on the 'Y' axis and SCANNER MODELS on the 'X' axis, and post it for d/l on their web site for a reference. That would be quite an undertaking.....sounds like a job for "SUPER RICH" (Wells) ;-}

> What does this mean, and more importantly, what scanners do the "right"
> steps?

"Steps" are the frequency increments by which the
scanner searches. Supposing you set up a Search
for 868.950 - 894.000 MHz, the scanner would default
to some predefined "step". The above is the USA
cellular base band. In Europe, the increment between
"channels" is 12.5 kHz; in the USA it's 30 kHz.

Depending on the band and the scanner, "steps" are in
5, 10, 12.5, 25, 30, 50, and 100 kHz increments. Many
scanners so not offer user-selectable steps; some do.

In any event, "steps" are a Search function, not a
scan function. Depending on the band and the scanner,
you can program in a series of frequencies as little
as 2.5 kHz apart. This increment is not called a "step",
because programmed channels are a SCAN function, not
a SEARCH function. Steps are a SEARCH function, you
see, where the scanner's CPU takes control of the
increments within a band where the frequencies are
sampled for activity.

Again, most scanners do not allow the user to select
the SEARCH steps, BUT prior to 1994, GRE cellular-capable
and cellular-modifiable scanners had the desired 30 kHz
default steps for the cell bands. All scanners made by GRE
did whereas all Uniden scanners defaulted to 12.5 kHz steps.

You can see, then, where in the USA, 30 kHz steps are
"right" and 12.5 kHz steps are "wrong". A scanner stepping

in 12.5 kHz increments would take over twice the desired time to cover the cellular band as one that did 30 kHz steps. Furthermore, a 12.5 kHz stepping scanner would not hit center frequency except every 150 kHz. At every step, it would be a minimum of 5 kHz "off frequency" except at the 150 kHz markers which is evenly divided by 12.5 kHz.

A 30 kHz stepping scanner would take 5 increments to cover 150 kHz whereas a 12.5 kHz scanner would take 12 increments to cover the same range.

A list of cell-capable and cell-modifiable scanners is contained in my regularly posted SCANNER MODIFICATION FAQ, the latest version of which was posted within the last 24-48 hours, so you can refer to it for the "list".

There is a store with a special on the R10 $400 instead of 500. I wanted some opinions on this radio.. How is reception, audio, Ease of Use programming wise? Also how easy is this receiver to hookup for computer control.. Any information would be appreciated. I realize it goes 7 Channels / second and that isn't a concern for what I will monitor on it because My local stuff is all on my Trunktracker. I would have gotten the AR8000 but it was 590 and upon superficial comparison the R10 seemed about equal

Jack,
PROBE 4.0 is the one !!
I have used several software programs,SCG,CCScan, and one other
dos based program but none even come close to PROBE, not to mention
how easy it is to set-up, and get scanning !!
Probe 4.0 has some very cool features that none of the
other scanning programs have even thought about including in their
software.
This is a DOS based program but don't let that scare you, its a piece
of cake to use.
That was only MY opinion.

4122. Need CTCSS tone info

Newsgroup: rec.radio.scanner
Date: 1998-05-09 00:00:00 UTC
From: jcarra@xmission.com
Message-ID: <3554d249.15787147@enews.newsguy.com>
Source record: 161005
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I'm pretty new to this and got my BC895XLT yesterday (after deciding that this base unit gave me the best of the Uniden and RELM handhelds that I initially inquired about on these newsgroups).

I've used tone search to set up CTCSS for several frequencies but I'm wondering where I can find a reference so I can program the tones directly. I've looked at several frequency listings and none of them give tone information. The searching is very tedious on infrequently used channels and I'm getting a lot of interference (intermod ?) in the 150 range that I'd like to use CTCSS to block out.

Also, I've noticed that my city police (460's) use a single tone for all frequencies but the county sheriff (150's) uses a different tone for each frequency. Can someone shed some light on what this implies about the different systems?

Thanks much,
Joe

You could be in more trouble for breaking your contract with the high bidder
than anything else. If the FCC were watching EBAY do you think there would be
an ad for a 3 KW CB linear or 700 channel CB tranciever every third line?

The best fix for the priority function is not to use it. It is less
than useless IMHO. Cathy's battery pack mod allows you to
recharge the batteries in the scanner and I highly recommend
it although I didn't follow her procedure exactly.

Maybe I'm off base, But all the whining about communications going digital
in the public service bands is being wasted. The public should be able to
listen in on all public Service bands. how are we going to hold these agencies
acountable? How Are news agencies going to know when certain activities are
going on? Wth digital secure communications cops Can keep us in the dark?
I'm rambling. Before long we won't need a Constituition, the public will
allow goverment do as they wish. When will it stop? I was a news photographer
for ten years. I had my camera confiscated from me twice, because the cops
could, I filed a law suit, raised a big stink and won! Yes you can beat city
Hall I did! Speak up the Constitution it was written for you. Sure the cops
can have digital com but aslong as we can listen in!
Bill

By your statements above it is obvious you don't know much about current copyright law. I would suggest you do some more research on some of the excellent web sites that discuss copyright law.

One does NOT have to register or even post a notice of copyright in their work. There are some advantages to doing so but under current law it is NOT required to obtain copyright protection.

Does anyone have a schematic for a pro 2026.
Or maybe tell me what parts to replace.I tried the c3128 transistor-
It didn't work.The scanner seems to work in every aspect, except recieving
signals.
A high powered cb 5000 watts nearby blew out the recieve in it.
Any advice will be helpful.
thanks

4139. G/Wiz works great on EDACS System

Newsgroup: rec.radio.scanner
Date: 1998-05-10 00:00:00 UTC
From: Levi <xxlevi@gte.net>
Message-ID: <6j5a0t$3iu$1@gte1.gte.net>
Source record: 160864

For anyone interested, I just got back my Pro-90 scanner with a G/Wiz installed. It really works great if you happen to live in a city using the GE/Ericsson EDACS communications system.

G/Wiz blocks out all the tones and buzz that will lock up you scanner while the response to a message is broadcast on another channel and you miss it.

I got my G/Wiz by getting the information from the ScanMaster web site at: www.scannermaster.com

I am in no way affiliated with the company, just a satisfied user.

I have a descrambling program for the computer for frequency inversion,
all you need to do is run a line from the speaker jack of the scanner to
the mike input of the soundcard and it plays back through the sound card
speakers, if anyone would like it email me and i will send it along,
it's only 93kb's so it won't take long to download.

Bill Cheek <bcheek@san.rr.com> wrote:
: "Steps" are the frequency increments by which the
: scanner searches. Supposing you set up a Search
: for 868.950 - 894.000 MHz, the scanner would default
: to some predefined "step". The above is the USA
: cellular base band. In Europe, the increment between
: "channels" is 12.5 kHz; in the USA it's 30 kHz.

Well ...

Allmost right. :-)

In Europe *cordless* phones use 25kHz steps.

Cellular (from 890 to 960 MHz) is all digital, multiplexed
(8 connections per chanel), and scrambled! It uses 200kHz
steps.

There is another digital cellular phone system operating
between 1710 and 1880 MHz, about which I don't know the
details. But it too doesn't use 12.5kHz steps.

In some european countries there is an "older" public phone
network operating between 450 and 466 MHz that uses various
stepsizes (20/12.5/10 kHz). It's analog, but truncted and
scrambled.
Those are not *cellular* phones.

There used to be another, which used some bands within the
148 to 163 MHz range, but this one has gone outof service
a few years ago. It used 20kHz steps and communication
was in the clear.

BTW: You're not allowed to listen to any of those over here. :-(

While you seem to know a lot about how things are in the US, you
should better inform yourself, before publishing "facts" based on
guesses. ;-)

If somebody *realy* is interested, I can post (or mail) all the
details I might be able to dig out.

Regards,
Friedhelm

From: Gary_Jacek@bc.sympatico.ca
Message-ID: <6j38nu$mq2$1@news.bctel.net>
Source record: 160923

Strangely enough, I was given a Pro27 200-0108 just last night.
Brought it home, popped in a couple of Xtals and a fresh battery.
It receives fine, but the squelch knob does not seem to DO
anything. No rushing-water sound can be achieved.

Opened it up and VR2 appears to be non-functional when tested.
Can anyone tell me the correct value for VR2 (the squelch control)?

This radio has a non-standard screw-type antenna connector.
I soldered a same-thread-size screw to the tip of an SO-239
to adapt it for an outside antenna. Made a big difference.

If you dont mind the slow speed, it's a very nice radio. The available cloning software from Icom is pathetic, but there are a number of other software packages that support the R10. It's very easy to set up for computer control. All you need is a cable that converts RS-232 to TTL level signal. I'm presently using the PC-to-R10 cloning cable, with a home brewed convertor that switches tip and ring. Cloning and PC control use two different recepticles on the radio, and Icom switched the internal wiring for the ports for some reason. An easy way to go is to buy the cloning cable (can be had for about 25 bucks from Grove) rather than make it, [SARCASM=ON] especially if your as good with a soldering iron as I am [SARCASM=OFF] The 232->TTL convertor is fairly simple and there are a couple of web site that have the layout. It was just easier for me to buy it. Then all you do is build the cable to switch tip and ring, and voila, your radio is hooked up to your computer. The only problem I'm having right now is the squelch detect and getting the scanning software to stop when it hits an active freq.

I like my R-10, especially the size (I travel with it a lot) and I'd recommend it with the caveat that you wont get great scanning and/or searching speed. If you can live with that, I say buy it.

Drop me a note if you want more info.....

>Its worth what someone is willing to pay for it.................

Sure but most people wouldn't spend $340 on a used scanner that was being sold for $200 new when it was discountined. Also, if you wanted to buy a scanner from an overseas company, you could get a Yupi 7100 for $300 or an A8K for $425, which is not much more to pay for a helluva lot more scanner!

>Thats you opinion it is worth half of what he's asking
> I wouldn't sell mine for double that!

Yes, it's my opinion. Thanks for allowing me to express it. Personally, I think the AOR2700 was a dog of a scanner at the original price and a very good one for $200. How much did you pay for yours?

> Worth a look..its freeware :)

I don't know the program (I use Probe/OS535 which does the same thing) but will he have to tap the discriminator in the BC895 to use it?

Finding CTCSS can be a chore (well, it's a snap with the Probe/OS535 but we're talking about the BC895). Have you checked a good frequency guide? I use one of the ScannerMaster books--they're available for different parts of the country--perhaps there's one in your neck of the woods. They list CTCSS tones in mine. Also check some of the web sites. Many cover specific areas and have detailed info.

4177. Why only 1/2 of conversation when monitoring cells?

Newsgroup: rec.radio.scanner
Date: 1998-05-10 00:00:00 UTC
From: mbtins@yahoo.com
Message-ID: <6j4f6k$jp0$1@nnrp1.dejanews.com>
Source record: 160935

Here's a question that may be kind of silly, but I'll ask it anyway...

Why do you only hear 1/2 of the conversation when monitoring cells? The system is not 1/2 duplex, is it? Do the TX and RX take place on different frequencies, or what? Sometimes, however, I can hear both sides just as plain as day, however this is certainly much more rare.

Just curious. Thanks for any help. Mike

BUT, also remember that the federal government made listening to cell calls a FELONY.

A over zealous DA COULD pop you for it if you were caught with a "moded" scanner.

Just a thought.

mbtins@yahoo.com wrote:
If you only hear one side you are hearing just the mobile. Yes the
frequencies are paired. The phone is full duplex so it needs 2
frequencies.

Look at where you have heard both sides of the conversation and
concentrate your scanning in that area. This is the band for the cell
site and will give you both sides of the conversation.

Another problem you will note is that in the middle of the conversation
you will hear a chirp and the conversation ends in mid-sentence. This
is caused by the system transfering the call to another cellular
tower that is in a better location to service the mobile.

4194. TrunkTracker: Strange Talkgroup ID's

Newsgroup: rec.radio.scanner
Date: 1998-05-10 00:00:00 UTC
From: Jay O'Brien <w6go@xxxnospam.com>
Message-ID: <3555EF93.EB3352E1@quiknet.com>
Source record: 160952

I am monitoring a 27-frequency trunked system which includes Law enforcement talkgroups. Usually the agency uses three dispatch channels, which show up as IDs 8208, 8240 and 8272 on my PRO-90.

It appears that at night and on weekends when they reduce to two dispatch channels, combining 8208 and 8240, the ID that shows up is either 8211 or 8243, or the original ID plus 3.

On a night or weekend when 8211 is in use, no activity is heard on 8208, 8240, or 8243.

On a night or weekend when 8243 is in use, no activity is heard on 8208, 8240, or 8211.

These "odd" channels don't seem to comply with the Motorola numbering protocol, and as far as I can tell the users don't seem aware of the change. It seems that the users of IDs 8208 and 8240 are combined with no action required on their part. The "odd" IDs are not listed in any monitoring publications I have seen.

I have added 8211 and 8243 to my scan list. I am concerned that there may be others that could show up and I would like to understand the use of these IDs. This agency could on occasion reduce to one-channel dispatch, and I suspect that would be still another ID that I don't know about.

Can anyone throw some light on this for me?

Jay O'Brien

Source record: 160955

Hi.

UCLA uses a Motorola type II system. Main police/fire/ems dispatch (medical aid, smoke alarm, etc) is on group 80 ('tac-1'). I've been compiling group ids and came across this about 20 minutes ago:

Talk
Group Message
23 Dsptch to ambulance-emergency medical aid call
9751 Dsptch to ambulance-further details of call
80 Ambulance to Dsptch-ok

The strange thing being that the dispatch was on two talk groups I have never heard before. While the broadcast was being dispatched, I repeatedly pushed the "search" button on my BC895XLT expecting to find this transmission on other groups as well (perhaps this was being broadcasted on all talk groups), but the first was exclusively on group 23, while the second on 9751.

I noticed something similar yesterday with a fire dispatch (involving another mystery talk group: 119). Both incidents were 'code3' responses. Any ideas why I'm seeing these weird groups?

Thanks,
Chris

Many but not all cellular carriers do not re-transmit the cellphone audio over the cell tower. In the NY area , if you listen to AT&T (the "A" carrier) you will get both sides 870-880Mhz. If you listen to Bell Atlantic (the "B" carrier) you only get one side of the conversation 880-890Mhz Yet in both cases you are listening to the cell tower not the phone outputs which are down in the 820's and 830's.

2,9, and 0:

Display Test of all LCD's. Also press any key and the test frequencies are loaded.

2,9, and Scan:

This produces "-Load-" message on display for approx. 1 second and loads test frequencies into channels 1 to 19.

2,9, and ".":

Decimal puts an "H" on the display; press delay and the display changes to "L".

2,9, and E:

Produces "-Load-" again for 8 aprox. 8 seconds, loading 144.000 in channel 1 to 149.980 in channel 300.

2,9, and Delay:

Puts radio into a Hex Display starting from 000 0f to fff 36

2,9, and SRC:

Displays the trunk symbol and "Ct - - - - - ".

The information above was posted by: David M. McCormick <dmccorm@holli.com> on 10-30-97.

Depending on what you consider a 'mod', the discriminator output can be tapped and used to feed any number of programs that can decode digital transmissions. This is done at IC3 pin 9 (a MC3371).

I also lowered the value of a resistor that was in series with RL1's relay contact. The closed circuit resistance of RL1's relay contact was too high and thus unable to properly switch on a tape recorder I had connected to it.

Several portions of the circuit board have blobs of epoxy on it covering something of unknown significance.

Chris Stankevitz (cstankev@NOSPAM.ucla.edu) wrote:
: Hi.

: UCLA uses a Motorola type II system. Main police/fire/ems dispatch
: (medical aid, smoke alarm, etc) is on group 80 ('tac-1'). I've been
: compiling group ids and came across this about 20 minutes ago:

: Talk
: Group Message
: 23 Dsptch to ambulance-emergency medical aid call
: 9751 Dsptch to ambulance-further details of call
: 80 Ambulance to Dsptch-ok

23 is a multi-select patch of 16 (UC Control) with another talkgroup.
9751 is a multi-select patch on 9744 (CHS Security). Talk-group
ID's are HEX, and the lowest order digit is used for status info.
(You'll occasionally see '88' for DES encrypted coms on 80 (Tac-1),
etc).

: The strange thing being that the dispatch was on two talk groups I have
: never heard before. While the broadcast was being dispatched, I
: repeatedly pushed the "search" button on my BC895XLT expecting to find
: this transmission on other groups as well (perhaps this was being
: broadcasted on all talk groups), but the first was exclusively on group
: 23, while the second on 9751.

Ok - it was a multi-select of UC-Control and CHS Security 8*)

: I noticed something similar yesterday with a fire dispatch (involving
: another mystery talk group: 119). Both incidents were 'code3'
: responses. Any ideas why I'm seeing these weird groups?

No mystery - 119 is a multi-select of 112 (Tac-2).

There are some other posts in the group detailing the status digit
map, and it's available on a number of trunk related sites, so I
won't waste any more bandwidth here unless you make me... 8*)

Looking for a used Ringo Ranger 2 or similar 2 meter base antenna for my cabin up north. Would like like something around 6 DB gain or more reasonably priced. Have a couple of 2 meter synthesized HT's that I may consider swapping one of them for the right antenna. Also have a 5 band trap vertical HF I would consider swapping. Will also purchase outright so let me know what you have via email please.

CTPDS49 <ctpds49@aol.com> wrote:
> I have heard that there is a bill pending in congress to ban all
> scanner radios. Is this just a rumor or does anyone know if
> this is really the case?

The bill is quite real, but its effects aren't that bad.

The original bill, HR2369, was a result of that "accidental" taping of Newt Gingrich which caught him red-handed breaking Congressional ethics rules. The bill made sweeping changes to the regulations regarding radio in this country, and carved out little slivers of "off-limits" freqencies throughout the spectrum. The ARRL, which normally sits on its butt when things affect scannists, woke up and did some lobbying, as did a number of public service groups. The latter were instrumental in getting the bill partially rewritten.

The revised version took a couple slices out of spectrum in 900MHz, 1900MHz, banned downconverters for cell/pcs phone bands (which leaves the future of the 33cm ham band in limbo, I'll bet), banned mods to "open up" cellular capable scanners, banned selling cellular capable scanners, and changed the Communications Act of 1934's famous wording which allowed listening to nearly anything but not divulging it, to disallowing listening except for a small set of exceptions -- those include the normal public service frequencies.

The revised bill passed the House 414-1 and is now sitting in the Senate Commerce Committee. It is expected to pass the Senate later this year and be signed into law.

What happens then is the subject of much debate. In the various scannist mags you'll find everything from "we got off easy" to "watch radios be decertified in pretty short order." I lean towards the latter but hope the the people who believe the former are correct.

Being a sucker for lost causes, I wrote some letters to appropriate senators (and actually got real replies!) about the basic ineffectiveness of the law. I don't have a lot of faith that my letters did much of anything, but I wanted to at least try.

There. Now, aren't you sorry you asked? :-) Further information can be found in Monitoring Times, Popular Communication, and other scanner-oriented magazines whose titles I can't remember now.

Source record: 160819
Cross-posted to: rec.radio.scanner,

NYSP tx frequencies are pl 110.9 (very few exceptions). All
inter-agency frequencies (155.37 and 155.475) are cs (tx and rx.) All
rx frequencies are no pl (cs).
Troop G is comprised of three patrol zones. I am told each zone uses a
different tx pl. So far I can only verify zone 3 (154.68 pl 167.9)
mobile to base.
Supposedly, zone 1 is (154.68 pl 127.0 mobile to base, and zone 2 is
(154.68 pl 146.2) mobile to base. All base to mobile for troop G is
155.445 cs.
Can anyone verify pl's for troop G zones 1 & 2 ?
How about other troops? Do they break up zones with different pl's?

Hi, all-

I just took a look at the ICOM PCR1000 PC Radio (external)
module. It's construction appears to be very good, and the specs
were very impressive.

Does anyone have one of these currently in use?

- What are it's caveats/pitfalls?
- Is $450 (new) a right price?
- Can it run on a 286, or does it need a 386 or better platform
for software compatibility?
- Does the PC create terrible RFI?
- Is the channel memory limited (nothing in documentation)?
- Is the DSP a necessary option?
- How's the SSB reception and stability?

What else did I forget to ask?

TIA-

=vt

Metro West sells an aftermarket battery for the 3000 (as well as other
scanners) for $65 and they will refund you up to $25 for your old one.
Also the battery is supposed to give you 50% more runtime due to the
type of cells used.

<snip>

Keith,

Yep, it's pretty easy on the BC895, just a bit slow when a channel
isnt very busy. I've managed to get the codes for almost all of my
most listened-to frequencies and figured out that the 460's used by
suburban agencies use the same code as city police.

Thanks for the tips!

Best,
Joe

Whats really fantastic is that most scanner owners have given up at
this point. They are not writting their two Senators to try to kill the
bill, so in a couple of months, our hobby will be greatly impacted.
Also, just as with guns, this anti-scanner legislation is
incrementalism to the max, but few are paying attention well enough to
realize this. Incrementalism occurrs when laws are passed, as with
anti-gun legislation, that remove guns or in this case, scanners slowly
from the public. All guns WILL be outlawed in the USA within a few
decades, but far before then, all scanners will be gone and only an
image deep in your memory.
Americans have become pussies. The government owns your asses because
of it. Don't bother to do anything, just sit there and watch your hobby
be taken from you.

Scanners manufactured in the last few years are "un-blockable," at least in the cellular range, because of applicable legislation. (Assuming you're in the USA, and bought your scanner there, too.)

Not sure, though, how you should be able to "hear both sides" of a cell phone conversation by being close to the phone itself. The phone only transmits one half of the conversation -- the cell phone user's side.

If you were really close to a tower, you may be able to hear both sides of a conversation, although the PRO-90 rejects images pretty darned well.

Source record: 160838

anyone know of any keypad tricks or mods for the Relm HS-100?
I recently aquired one and I like it, its built solid and the whole
radio
section is incacesd in a shilding box, so its hard to get at it to do
mods
the main thing I want to do is to keep the light on
till I press the light button agin.
Any help?

Hi Guys
I never buy them. If the thing is gonna crash it usually will do it
within the first twelve months, At that time you usually have a return
policy that allows you to hand back the bad one and take a good one at
least what I've found with radio shack and others. If you don't then
change the place where you buy your material.

PCR 1000 software runs under Windows 95, and requires at least 486 66 MHz, but I'd recommend a Pentium. PC controlling the receiver should not cause any RFI. DSP card (UT-106) is only an option, and number of memory channels is limited only by your PC's hard drive space. Main oscillator and BFOs are very stable, therefore providing a good SSB reception.

I have difficulty in getting audio out of Pin 9 (according to Bill Cheek's chart). When I connect my headphone to Pin 9 directly or via 10 uf-- no avail no sound at all.

Nor I can get any audio out of Pin 9 when I attache 10 uf (+) and (- to ground). No audio at all. In this situation the scanner's headphone jack is dead and the LCD panel is malfunctioning. The frequencies slightly (+) from their normal broadcast. Like weather is 162.5500 then it become like 162.6600 or so. Why? any idea!
thank u .

The old saying goes " If you want something done right, do it yourself"
Well a friend of mine who has experience in radio repair tried to modify my
AOR 8000 for reaction tuning by installing a 2.5mm jack into the side of
my radio. I think he may have fried the resistor. I don't get any type of
response when it's hooked up and no response when I try it with the flat
cable... The scanner works fine other wise. I could of screwed it up
myself...Help. Anyone know of a good scanner repair shop, or know where to
send it.

Thanks for the vote of confidence Cathy! I already have a Scanner
Model FAQ : http://www.qsl.net/n2mca/MODEL.HTM

In it are the following categories :
Models covered
Models in current production
Newly introduced models
Models awaiting production
Models which seem to have "good" reputations
Models which seem to have "tarnished" reputations
Radio Shack models manufactured by GRE
Radio Shack models manufactured by Uniden
Models with TrunkTracking
Models which are crystal-controlled
Need information on the following models
Frequency range and mode table
Scanner information table
Accessories
References

An example of the 'Frequency range and mode table' is
Model Frequency Range Modes
AR160 29-52 136-174 436-512 FM
AR1000 8-600 805-1300 AM FM WFM
AR2000 500kHz - 1300MHz AM FM WFM
AR2001 25 - 550 AM FM WFM
AR2002 25-550 800-1300 AM FM WFM
AR2500 1 - 1300 AM FM WFM LSB
USB
AR2515 5 - 1500 AM FM WFM
AR2700 500kHz - 1300MHz AM FM WFM
AR3000A 100kHz-824MHz 849-2036 AM FM WFM LSB
USB CW

An example of the 'Scanner information table' is
Legend
Capitalized letter or number is used in table for reference to
item

Price average retail price while model was in production
1 = Price < $ 250
2 = $ 250 < Price < $ 500
3 = $ 500 < Price < $1000
4 = $1000 < Price < $2000
5 = $2000 < Price < $5000
6 = Price > $5000

In my 'New Scanner Users FAQ', which I post about every two weeks, I have
topics in it titled :
Look Before You Post
Don't Ask What The Best Scanner Is
Picking A Scanner/Receiver
which help readers(who take the time to read) through the features and options found on today's radios and as well as other decisions which they will be confronted with and how to best pick the model which will be right for them.
Between this information, as well as the 100+ web pages I maintain and the reference to other pages and useful FAQs by Bob Parnass, I've done my best to lead the horse to water, but we all know how the rest of this saying goes... ;-)

Strong signals,
Rich Wells N2MCA http://www.qsl.net/n2mca/

Exactly what type of emergency freqs are you interested in? Local?
County? State? Federal? Are we talking disaster relief/FEMA type,
SKYWARN, or just typical ambulance/hospital?

Try my home page below. Following the link to Radio Monitoring. Page
down to the bottom and follow the link for 'Local frequencies'. There
you will find my personal list as well as one kept for the area by
the Tarheel Shortwave/Scanner Group.

I would also suggest picking up copies of Police Call(at your local
Radio Shack) and Monitor America(carried by most scanner and amateur)
radio dealers).

Good luck with your quest!

Hi,

Typically, the sources that are out there don't include CTCSS information. And, some of the ones that do provide that information, it's not correct anyways. Sure, you could use some neat-o program and decode CTCSS on the fly. That's IF it will work with the output jack, etc, etc.

What will be alot more rewarding and will probably work the easiest is just to sit down for a few hours on a busy night, and decode them yourself. This is guarenteed to provide results, and I'm not sure about the BC895, but it should be relatively easy once you do a few of them.

I got lucky because a friend of mine works for a local EMS, and had the radio programming configuration chart with the local towns, PL tones, etc.

You could also check with your local radio club or volunteer fire dept. They usually have something like this floating around.

Good luck with your search.
Keith

There are wireless microphones here as well.
BTW, the old Heathkit Hero 2000 robot control consoles
(models ETS-10-35, ETS-19-36) use 75.43 MHz and 75.67 MHz.

4268. BC 235XLT question

Newsgroup: rec.radio.scanner
Date: 1998-05-12 00:00:00 UTC
From: daleeh@aol.com
Message-ID: <1998051219420100.PAA01236@ladder01.news.aol.com>
Source record: 160658

How can you scan individual banks in the conventional mode? After programming several trunked systems into the scanner, I wanted to put some conventional freqs in the empty banks. When attempting to scan these conventional freqs, I found I continually stopped on the "800" freqs programmed for the trunked systems. The only way I could figure out to skip the trunk freqs was to lock them out. This is sort of a pain since I had 6 banks programmed for trunking. Is there a simple way to skip the trunked banks? Any other tips?
Dale

Good post Chris...

However we do buy scanners that are what they say they are...800 - 100 Mhz coverage...other " agencies " slip into the blocks (depends where you live)

However I do understand you post well.

The USA Govt says you can buy a V8..however they have BLOCKED 2 Cylinders...this WOULD bring an outcry , of how dare they..!

There reason : For Safety Sakes...

I am glad for 1 thing , In Canada where I live we have no such laws...(YET) However the Canadian Govt is a Monkey see , Monkey Do...who knows , full coverage scanners today...No Scanners Tommorow.. ?

I did like your Post...and just wanted to add my 0.02 Cents worth , and if this 2 cents was in CDN funds...would mean I owe you $$... HI HI

Come tho think of it , b4 I close this post....a US buyer of a scanner in Canada would gain $$ wise....

1 US $ = (Aprrox) 1.43 CDN

You in the USA come out ahead...now how do we get the units over there :)

I too have a scanner with a G/Wiz board from Scanner Master and it's great. But now you can TrunkTrack GE/EDACS systems flawlessly using only standard 800 MHz scanners (don't even have to be TrunkTrackers), a cable, and a piece of software called etrunk.exe. Check out:

http://web2.airmail.net/lblant1/trunked.htm

For info on how to flawlessly trunktrack EDACS systems, with example screen shots of DFW Airports system (GE) being tracked using etrunk. The legality of this, though, is debatable since monitoring alpha pagers has been unofficially concluded illegal by the U.S. Attorney's Office in NYC.

Ya'll enjoy!

Dan

4273. FS: Motorola Voice Pager with Monitor

Newsgroup: rec.radio.scanner

Now available for the first time a Motorola Keynote pager with monitor. We take a reconditioned Keynote pager add our unique monitor adaptor and turn it into a functionally equivalent of a Minitor II pager in the monitor mode. The pager can be switched from monitor to non monitor mode. Available options Vibrator, Voice Storage, chargers, and extended warranty. The price varies depending on the options you need so go to our web site for all the prices, $135 to $170 each.

Over 1,000 pagers in stock, all bands available - low band(32MHz to 46 MHz), VHF, UHF, and 900 MHz

It really depends on how much the original item costs, the percentage they charge for the insurance, the type of item, etc. Depending on what it is, I say its typically not a bad idea. I typically err on the safe side, because I'd rather pay a few dollars now than a whole bunch later.

Examples... I paid $500 for an extra (almost) bumper-bumper warranty on my vehicle. This added 2 years and 40,000 miles of coverage. Although I've had minor repairs, it has paid for itself already, and I'm not at the maximum time limit yet.

I paid $99 extra on my new Dell 333 computer. This extends the onsite maintanence of my computer from 1 - 3 years. With the cost of motherboards, monitors, soundcards even, etc. If ONE thing goes wrong, it pays for itself.

Now, I would *never* pay more than a few percent for the insurance. In both cases, it hovered around 3%. This is reasonable and gives me the piece of mind knowing that I won't need to shell out the bucks in the future. Better safe than sorry ...

Keith

MAlexde (malexder@aol.com) wrote:
: I think service contracts, extended warrantees and not good for consumers. I

Is 'unencryption' and American term?

If you can, as you say, buy a scanner which decrypts
digital encryption, then that doesn't say very much
for the encryption system (?)

(Or it's not encrypted, merely digitally encoded).

Milan, IL uses this band for telemetry from a flood-control levee. Presumably water levels and flood alarms from the Rock River.

Source record: 160669

I have a Bearcat 800XLT and the greed LEDs are so dim you can't read them.
Otherwise, the scanner is perfect. Would anyone have a fix for this
problem, or a copy of the schematic they could email me?
Thanks All,
Buddy Woodzell

Play on words, maybe, but no it won't....not unless
you program in freqs 30 kHz apart. The 30 kHz
thing is the STEP increment for the SEARCH mode;
not the "scan" mode.

I wasn't talking about *cordless* phones, though.
At least, not what the kind we Yanks use.

> *Cellular* (from 890 to 960 MHz) is all digital, multiplexed
> (8 connections per chanel), and scrambled! It uses 200kHz

THAT wouldn't be an issue for scanners, anyway.

> There is another digital cellular phone system operating
> between 1710 and 1880 MHz, about which I don't know the
> details. But it too doesn't use 12.5kHz steps.

Neither is that one an issue for scanners. We're
talking about the conventional voice cellular bands.
The kind that *some* scanners can detect.

> In some european countries there is an "older" public phone
> network operating between 450 and 466 MHz that uses various

But that isn't or wasn't cellular, either.

> BTW: You're not allowed to listen to any of those over here. :-(

No shit? I thought you guys were more enlightened than us.

> While you seem to know a lot about how things are in the US, you
> should better inform yourself, before publishing "facts" based on
> guesses. ;-)

Sorry, but I wasn't "guessing". And we ARE talking
about scanners, no matter what. Your exceptions are
not within nor even close to the scanner realm.

> If somebody *realy* is interested, I can post (or mail) all the
> details I might be able to dig out.

Somehow, I doubt that anyone is interested in the
exceptions that don't pertain to scanners and scanning.
But I could be wrong, I guess.

> listening to personnal phone calls.

Not necessarily. In fact, you can't legitimately
assume anything about this "craze". It varies
with the individual. For one thing, the analog
cellular system is almost a thing of the past,
and one day it will move on up high in the band.
People will THEN want their scanners to be able
to cover the full 800 MHz band which would likely
be legal.

After all, the present cellular bands used to be
a part of the UHF TV band. Older UHF TV's that
go to Channel 82 can be used to listen to cell calls.

Unrestricted coverage is a goal for most radioists,
even when they have no interest in listening to
certain bands....say cellular.

First, it isn't the Display. It's the Electroluminescent
Panel that's used for the backlight. It slips in behind
the Display.

And no, replacements are not available any longer.

And no, they're not particularly "easy" to change.

I am working on alternatives for this, but don't
have any definitive solutions at the moment.

Announcing:

."Hamfest INDIA '98".

To be held in Bangalore, South India.

Bangalore, high tech and ham capitol of India, is proud to host this hamfest in the
75th Year of Amateur Radio in India.

1500 hams are expected to attend this three day event. All foreign hams are
welcome and encouraged to attend.

2nd Oct. 2pm Registration.
3rd Oct. 10am Doors open, technical meetings, exhibits, etc.
lunch and dinner included.
4th Oct. Planning meeting and closing of hamfest after lunch.

Activities during the hamfest will include exhibition stalls where
manufacturers in electronics and other related products will
display their wares.

The registration fee is Rs.200/- This is about $5 U.S./

If any one needs assistance booking hotels,
sightseeing trips, etc., we can help.

For more information visit our web site at:

http://www.angelfire.com/in/hamfestindia98/

or contact:

- VU2LU, Ramesh, vu2lu@hotmail.com (India)
- WA5VPW, Jim, jpfin@worldnet.att.net (United States)

73 and hope to see you in Bangalore in October!!

4297. REQ: Antenna recommendation

Newsgroup: rec.radio.scanner
Date: 1998-05-12 00:00:00 UTC
From: Glenn & Roni Gehlke <festfan@nospam.ecis.com>
Message-ID: <6jas7s$1o9$1@news.tdl.com>
Source record: 160687

I have a Uniden BC80XLT handheld scanner and am interested in an antenna that I can attach to the roof of my car and that will significantly improve reception in the 148-174 MHz range in particular. (I enjoy listening to the railroads.) I am currently using the factory provided rubber antenna and have limited range.

Also, I'm interested in an antenna I can use at home that will accomplish the same task. Would be nice if it would work for other frequency ranges as well, although I'm not as concerned about that.

Any recommendations? Thanks in advance.

Glenn.

4298. IRL Scanner Freqs....

4299. FreeTracker Problems

Newsgroup: rec.radio.scanner
Date: 1998-05-12 00:00:00 UTC
From: Andy Ulrich <ulrich@null.net>
Message-ID: <6jatuq$2nr@bgtnsc01.worldnet.att.net>
Source record: 160689

Has anyone else experienced this problem?

When using FreeTracker with my BC895XLT, it appears that the computer only receives some of what the scanner is sending it via the serial cable. The symptoms include:

1. Sometimes everything works fine (but that's happening less and less often).

2. The scanner always receives all commands I send it via FreeTracker.

3. FreeTracker always receives all info from the scanner when I select the option which downloads all freqs from the scanner to the computer.

4. Often, when the scanner stops on a freq/trunkgroup, FreeTracker doesn't react to it by displaying the freq/TG and doing a database lookup. FreeTracker doesn't do anything.

5. Often, when using FT to enter trunking mode, the message which says, "Finding control channel" never goes away, even when the channel is found.

6. When I go to "BC895" on the tree and select "show scanner output," and the scanner stops on a freq, sometimes the scanner produces two lines of text; sometimes only one. When it's only one, that's when FT doesn't display the freq.

What's my problem? Should I be concerned about baud rate, Xon/Xoff, etc? The computer is a Pentium 120, so while it's not a speed demon, it's not like some slow boat anchor, either.

Any tips would be helpful! Thanks.

Andy Ulrich

What I like are those setups for the 2-meter rigs, that are nothing more than a BNC extension cable, and a clip to slide on top of the window before you close it.
Simple set up, but allows many uses, including a crude antenna in an apartment setting. Now, what you use on the extension is up to you...if you're looking for a specific freq, find a telescoping BNC antenna, and adjust it's length according to freq needed.
Always has worked for me.

4301. Interview w/Cell Freq. Criminal

Newsgroup: rec.radio.scanner
Date: 1998-05-12 00:00:00 UTC
From: allsafe <allsafe@netwit.com>
Message-ID: <35591009.6A7BB157@netwit.com>
Source record: 160691

There's a great deal of opinions that listening to cellular conversations is boring. But some people find a great deal of amusement in listening to cell calls. In fact, I interviewed a person that regularly listens to cell calls. This person is an acquaintance who agreed to this interview. For the purposes of this piece, I'll call him "Bob". Although I used the three letters of his actual first name, his *real* name has the letters arranged in a totally different order.

Q: How often to you listen to cell frequencies Bob? (if that's your real name.)
A: Pretty much every night. Daytime cell traffic is pretty boring, it's mostly real estate agents, contractors and business people and the occasional call to the wife at home. But once you hit about 8 P.M. to midnight, it gets pretty interesting.

Q: What do you find interesting?
A: There's all kinds of stuff; drug dealers, cheating wives and husbands, hilarious fights between spouses, kids and parents. All kinds of stuff.

Q: Doesn't it bother you that you're intruding on private conversations?
A: Naw. I don't know who these people are. They're just faceless voices within about ten miles. My scanner will pick up the cordless phones of my neighbors, and it bothers me to listen to them, because I have to face them every day. So I don't do that. For some reason, listening to people I don't know doesn't bother my conscience. So I just stick to the cell freq.'s.

Q: Aren't you afraid of getting busted?
A: Well, there's a chance you could get busted. But as long as you listen, and don't open your mouth to anyone about it, or act on the information you hear, you're not likely to get busted. That may change in the future, but I've been pretty lucky so far.

Q: Tell me more about what you find interesting.
A: Aw man, there's all kinds of stuff out there. Friday and Saturday nights are the best.

Q: Give me some examples.
A: Aw jeez....where to begin? There's so much stuff: I heard this guy talking to his wife, and she's pissed. She's accusing him of having an affair, he's denying it. She's really going off. And then his "call waiting" goes off. His mistress is on the other line. He switches over and tells her the "bitch" is on the other line and to hang on for a sec, then he switches back to his wife and tells her it's his mother. She doesn't buy it. Man, you shoulda heard it.

Then there's the relationship calls between older dating couples and married couples. The arguments are a hoot. You can tell when the guy f**ks up and says the wrong thing. The guys *always* say the wrong thing. You almost wince when you hear it. I also pick up pointers on how to deal with my own wife from the smooth guys.

One night, every freq. I stopped on was a woman bitching out a man for one thing or another. Every damn stop. Couldn't believe it. I must have listened to a dozen consecutive bitch-out sessions with the guy on the short end of the stick. I started thinking that there was something in the air, and my own wife would be bitching soon. She stomped downstairs to my den and started bitching not more than a half hour later. I don't know what was going on that night. There wasn't a full moon or anything, but all the women seemed to be on the same bitchy frequency. I'll never forget that night.

Then there's the stupid drug dealers and users: "Hey dude", "Yeah man", "Uh.....I was wondering if you....got those.....car speakers?" "Uh....yeah,.....I'm getting some pretty soon...how many you want?" "Uh......three...if it's...uh...I mean if *they're* good."

Then there's the gay men arranging their clandestine meetings. These guys just get right to it. They don't seem to care who they do it with. They get a number off the wall or from a friend, give 'em a call, outlay the game plan and go right to it. I heard this one guy arranging a meeting with a guy he's never laid eyes on. They introduced themselves, the caller on the cell phone had a wife at home with a kid and was out in his car scheduling his next fudge-packing session. It's disgusting. I can't hang with those conversations for very long.

It's all kinds of stuff. I guess the only way I can explain it is that it's kind of like a guy's "soap opera" Same type of attraction that "General Hospital" or "All My Children" holds for the women. But this is the real deal.

Q: Can anybody listen to this?
A: If you got the scanner, sure. If you live in a rural area, you're not gonna hear much. But if you're near or in a major metropolitan area, you'll get an earful.

Q: Where can I get one of those scanners?
A: I got one for sale, but it's gonna cost ya.

Q: I don't care. I'll pay it.
A: Ok. But don't do anything stupid like taping anything or running your mouth off about it to anyone, Ok?

Q: Ok-Ok-Ok, where's the scanner?

A good magmount or glass mount antenna would do nicely. I have a RS
glass mount on my car and it cuts down on alot of interference.

4303. BC895xlt Base Scanner "How do I reset it"

Newsgroup: rec.radio.scanner
Date: 1998-05-12 00:00:00 UTC
From: Jim Peters <popular@earthlink.net>
Message-ID: <35593542.470A@earthlink.net>
Source record: 160693
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anyone know if you can reset the BC895xlt Trunktracker to the way everything was set when I received it from the store?

Thanks, for any help offered.

Jim, at "popular@earthlink.net"

4304. PRO-43, maybe for sale

Newsgroup: rec.radio.scanner
Date: 1998-05-12 00:00:00 UTC
From: PBR <PBR@cyberdude.com>
Message-ID: <35593A32.52EF47F7@cyberdude.com>
Source record: 160694

I live near the LA/OC border.

Paid $160 for it a few years ago. Cell mod. With rubber ducky and metal telescope antennas, and A/C adapter. Keys and speaker are in good shape (although some of the numeric digits are worn off the face of the unit.)

I'm not exactly sure I'm selling it, but I have to admit I'm not using it much anymore... I moved recently-- not as interested in the new neighbors! :-)

Anyone nearby in LA/OC, willing to pay cash, can drop me a note.

PBR@cyberdude.com

I say thumbs down! I never buy an extended warranty. If something's
going to go wrong it usually does it within 30 days.

I believe that Radio Shack's standard warranty for scanners is one
year which should be plenty. If you buy a demo or store display,
they'll usually double the warranty with no extra charge. Be safe,
buy a demo.

If interested or have any questions, please email: louman@usa.net

UNIDEN 20 CHANNEL SCANNER BASE UNIT
29-512MHZ

The Bearcat 148XLT tabletop scanner keeps you tuned in to all the local action in your neighborhood. Hear police, fire, weather, ambulance, military, "Ham" radio & more! This 20 channel scanner features automatic squelch to eliminate static between transmissions. Memory backup keeps the frequencies you programmed in "alive" when there is a power failure. Programmable delay stalls the channel for 2 seconds so you can hear both sides of the conversation. An "Alert" feature warns you from weather service frequencies when a bad storm is approaching. All these features and more from the first name in scanners, Bearcat!
Features:
20 Channels, 10 Bands
Weather Search & Alert
Frequency LCD Display
Channel Lockout
Automatic Squelch
Memory Backup
Programmable Delay
Manual Channel Access
Frequency Range:
10 Meter "Ham" 29.0-29.7 MHz
VHF Low Band 29.7-50.0 MHz
6 Meter "Ham" 50.0-54.0 MHz
Military Land Mobile 137-144 MHz
2 Meter "Ham" 144-148 MHz
High Band 148-174 MHz
Federal Government 406-420 MHz
70cm "Ham" 420-450 MHz
UHF Band 450-470 MHz
"T" Band 470-512 MHz

GeAr,

&#65533; WRONG !! Several reports recently issued by a few states, including
&#65533; NHTSA, clearly indicate the fatality rate in states which raised the
&#65533; speed limit INCREASED ! (by an average of +18%).

Better check your facts. Nationa Motorists Assocation (of which I'm a member) routinely dispels generalizations such as yours above. Before you flare up over my statement, I suggest you check their website for more information. In fact, just this month's newsletter indicated that the fatalities from higher speeds on some of the states' "super" highways did, in fact, increase; HOWEVER, when taken as a whole, one sees that the fatalilties on the lower speed thoroughfares fell considerably more - due to a movement of traffic from these slower streets to the faster highways - such that the combined total of fatalities DECREASED. FYI.

reply to Peter Ivakitsch------

The first reply you received took you to a Toronto website which the home page states is under construction, and maybe not much help.

A more direct answer would have been like this:

If you are using a scanner, enter 118.0-135.95 as your search frequencies and linten. All VHF aircraft tranmissions are Amplitude Modulated signals, so your scanner must be capable of receiving AM. Round up some frequencies you catch from using the search mode and then you can plug them into available channels.

Another trick is to listen as the pilot reads back to ATC a new frequency assignment. Quickly write it down. Then program in this new freq into an open channel. This will help you pick up more frequencies being used in your area.

There are lots of FAA frequency assignments, but only a small minority will be used in any given location.

Hope this helps

Well Police Call barely scrtaches the surface of what there is to listen to. The PL for my area omits several police and fire freqs, which is rather surprising since that is its main purpose. It's cheap, and a good place for beginners to start.

ScannerMaster provides extensive coverage on virtually everything worth listening to in my area as well as detailed description of how various radio systems and departments and businesses operate. Mine is 694 pages--well worth the $35.

I wouldn't worry about it so much. First remember that things change fast, technology is moving very fast and the scanner market is booming. The companies that are making big bucks are already addressing the digital issue. Look what happened with trunking. A lot of people thought trunking would make scanning a thing of the past and now we have trunk trackers, nice ones too and they aren't that expensive. Soon there will be digital scanner decoders. It's just a matter of time until the red ink at the scanner companies starts to show up on the bottom line. They will all be scrambling to make the digital scanner. I bought a Pentium II 333mhz computer last month and a week later they were out with 450mhz. I couldn't give my 486dx4/100 computer away and I paid big bucks for it when I bought it not too long ago. Chips are making it easier to accomplish the scanner changes too. These companies will continue to offer encryption and the other side will continue to offer unencryption. Sell your scanner if you can't listen to it, buy a astro that will unencrypt if u have an extra 2 grand. or wait until the radio shack scanners do the same thing for less money. It will happen.

I'm not sure which one you are interested in, but I've had good luck with this
FCC beta data base:

http://gullfoss.fcc.gov.8080/cgi-bin/ws.exe./beta/genmen/index.hts

Just select what type of search you want, fill in the blanks and GO.
A friend of mine got a new business band allocation at the end of
April and it is already in the data base.

I agree but we have to keep spending money everytime a technology
changes. Before ya know it we are gonna have a house full of scanners
LOL. I'm sure they will come out with digital scanners but for a big
price to the consumer. We need to keep working at mods and using the
computer interface to get around this having
to obsolete our scanners.

How about using the scanner with full 800MHz as an IF with a down converter from higher frequencies? It's what a lot of us were doing before all this happened.
How about using the VCO as a test oscillator, used to be very common with the older Bear Cat 210xl and it's loud harmonics. Was easy to modify and/or tap the multiplier chain.
How about using the scanner/receiver to track down intermod, mixings, spurs, illegal transmitters and many other utility uses.

that help?

I use three different J-poles on 2 meters. One is a permanently mounted copper cactus, and the other two are twin lead. The twin lead antennas are great for portability and easy set up, and all seem to work equally well. There is also one made from conduit and a metal electrical box that I have not tried.

For Sale: PRO-2006 scanner with the HB-232 computer interface mod. Very good condition, both internally and externally. Also has the beep delete switch. Includes the software for the interface. I bought everything new. Asking $350. I also have a VADER board that is made for this setup, asking $75 for that. Or you can have the whole package for $400 plus shipping. No trades. Please reply via EMail, as I don't check this NG every day.

It's the principle of the thing to most people.

Cellular is difficult and extremely boring to monitor, with a cellular
capable receiver.

People just don't like things being legislated out from under them.

I couldn't care less about listening to cell, but I want equipment to
be capable of monitoring anything anywhere within its design limits.

I suspect most feel the same way.

And the government is exempt which annoys many people. A volunteer
fire department qualifies to purchase cellular capable receivers.
What's the logic in that?

Also all the restrictions add an air of mystique to the forbidden act.

If used toilet paper were made illegal some people would pay a premium
and risk prosecution to hoard some.

On a recent overhead pass over Chicago we heard Mir on 143.625. Male speaking in Russian. Picked them up on every radio in the shack, including a Yupi 7100 with a telescoping whip and a Standard 528a with the factory, base-loaded rubber duck. Full scale, loud and clear for about 5 minutes. Their signal is a little more "wide-banded" than the usual public safety comms and the audio is a little distorted. A sat tracking program loaded with current keplerian elements will be a big help.

If someone want to monitor cellular, why not just get a double conversion scanner, like,the BC200XLT or the BC890XLT? I can hear cellular conversations on these models. Granted the signal comes and goes, but it also does this with "cell capable" scanners too, doesn't it? And the step size is 12.5 rather that 30(?) on most scanners. Most of the conversations I have overheard are as routine and boring as my own personal conversations :-)

4348. PR: AR8000 ToolKit 2.0 Now Available

Newsgroup: rec.radio.scanner
Date: 1998-05-12 00:00:00 UTC
From: ThisAddress@WillBounce.com
Message-ID: <I3061.1$si2.200569@news.aa.ans.net>
Source record: 160799

FOR IMMEDIATE RELEASE

CONTACT: Eddy J. Gurney (e-mail address below)

LIVONIA, Michigan -- May 11, 1998 -- EddyWorks, a subsidiary of The Eccentricity Group, today announced the release and immediate availability of a new version of AR8000 ToolKit(tm), their popular Macintosh-only shareware package for controlling and programming the AOR AR8000 hand-held wide-band receiver. AR8000 ToolKit 2.0, a significant enhancement to the initial release back in October 1995, has been in beta testing for many months.

AR8000 ToolKit 2.0 is available for download from the EddyWorks web site, located at http://www.mich.com/~eddy/works/

"In addition to providing a much easier way for AR8000 owners to program the 1,000 frequencies in their scanners, AR8000 ToolKit 2.0 now provides the ability to control the most significant features of the AR8000 from the Mac screen using the new ``Virtual AR8000'' feature," said Eddy J. Gurney, designer and programmer of AR8000 ToolKit. The "Virtual AR8000" feature provides a "simulated" display and keypad on the desktop, and operates almost exactly like a real AR8000. Not only does AR8000 ToolKit 2.0 provide an easy way to control the scanner while you continue to use your Mac, the new "InstaEdit"(tm) technology allows you to quickly transfer a bank of frequencies from the AR8000, edit them on the Mac, and send them back, all with no user interaction on the AR8000 itself! Similarly, AR8000 operating parameters (like delay times, power saver settings, etc.) can be controlled in real-time from the Mac.

Other enhancements in version 2.0 include fully native PowerPC functionality, full support for third party serial devices, and many new "user experience" enhancements that make working with AR8000 ToolKit even easier, even on small-screened Macs! Minimum CPU requirements are very reasonable (any Mac capable of running System 7.0 or later with at least 2MB of free memory) and thanks to extensive Balloon Help, learning to use AR8000 ToolKit is not difficult at all.

Product screen shots, upgrade information, hints and tips and more can be found on the product web site located at http://www.mich.com/~eddy/works/ or by sending e-mail to (address below).

AR8000 ToolKit and InstaEdit are trademarks of The Eccentricity Group. All rights reserved. Other trademarks, or registered trademarks, are the property of their respective holders.

4352. ICOM R2A SCANNER!!!

Newsgroup: rec.radio.scanner
Date: 1998-05-12 00:00:00 UTC
From: Jeff Goldman <75162.2371@CompuServe.COM>
Message-ID: <eiTFLZdf9GA.268@ntawwabp.compuserve.com>
Source record: 160803
Cross-posted to: rec.radio.scanner,alt.radio.scanner

ICOM America will unveil the R2A handheld scanner at the Dayton Hamvention on Friday! The actual street price will be around $199. Coverage will be from 25-1300MHz in AM, NFM and WFM modes. Like the Q7A, it'll be "drip resistant" and be somewhat durable for outdoor use. The street price of the Q7A Amateur transceiver/wideband receiver will also be $199. The Q7A will not have a keypad (as can be seen by photos on the ICOM Japanese webpage and Rich Wells' webpage), but will have PL decode. No word whether the R2A will have PL. Both radios are awaiting FCC Approval.

Jeff, CompuServe HamNet Scanning Sysop

Jeff Goldman has just gotten the scoop on the
Dayton pre-announce of the new iCOM R2 scanner.
Yes...a "scanner", and not a "communications
receiver" like usual.

Looks like the Sony SC-1 will have a little
direct competition!

I'm looking for a scanner that can be controlled by a computer. It must be controllable using standard C/C++ Dos or Windows.

Cost - in the $500 or under range
Bands - Only need the 440 MHz band, 145MHz a plus. Anything else not needed.
Mode - CW or SSB

Number of channels, etc is flexible.

Thanks!
Carlos

Item: Sears Dehumidifier
Service contract: 5 years
Location: Wet Basement
Cost: $59.95
Services rendered: New compressors: (4)
New huimidistats (2)
Recharge refrigerant: (3)
Bills written off: Over $1200 worth
Bottom line: What do you think?

It all depends what you cover and how the product is covered by the warranty extention. If RS covers cracked cases or dropped units these days, that's cheap insurance.

I havent seen a way to unblock it yet either. Very likely there is no way to unblock the cell. However, if you are near a transmitter, you will hear some images. when I am w/in 10-20 feet of a cell phone I can hear both sides fairly clearly. It is really annoying.

Two different animals. I believe we're talking solid state electronics
here. Of all the electronic purchases I've made in the last 13 years,
95% of them are still fully operational.

Oh I agree, but the original post slammed all warranties as bad for
consumers. I think the key is moving parts & take a good look at what is
covered in the fine print. Radio Shack warranties used to be looser than they
are now, covering almost anything if the consumer would stick to the story that
it "just quit working". They have gone to a pro-rated system now, but they used
to replace with the closest current model if an extended unit couldn't be
repaired.... I think they still do it on small items like headphones.
I'd get one on a VCR for instance, if I had a small child who watched 6
hours of tape a day!
```

Steve,

The NYC OEM uses the NYC DOITT (formerly DGS) Motorola trunked radio system. They have several talkgroups on the system. Refer to the following 2 links for frequency and talkgroup information:

http://www.bearcat1.com/fleetny.htm

Scroll down to this listing:

System: New York, City of
County: New York
Type: IIi
Fleet Map: Block 0 = S4, Block 1 = S0, Block 2 = S12, Block 4 = S13
Use: O.E.M., NYC Corrections, NYC Sheriff, Parks, Animal Control, and many others

Also check out:

http://www.trunktracker.com/states/ny.html

And scroll down to the title: New York City DOITT (Local Government) System

You would need a Trunk Tracker to be able to follow the transmissions effectively.

hope this helps,

Joe

Oh, I don't think I "slammed" all warrantees as bad... I wish I had the facts to back up what I'm about to say, but warrantees are highly profitable for the sellers and overly expensive for consumers.

To suggest getting warrantees for products with moving parts simply flies in the face of logic. Take major appliances,for example. Americans happen to make the most reliable majaps money can buy. I'll that everyone owns or knows someone who owns a fridge or a washing machine that is 15-20 years old that has never needed repair. Air conditioners, lawn mowers and most other products are that way.

The guy who is selling you the warranty is mainly preying on consumer fears or ignorance. Obviously a percentage of products go bad, starting from day one. I maintain the percentage is minute and that the manufacturer's warranty will cover a good part of potential repairs (I have a four year "everything covered, plus *seven* year powerline coverage on my car, for example).

Anyone wh pays $60 to cover a Radio Shack scanner that cost $200 has been suckered.

Brien,

> Remember that any item is considered in plain view if the police can see it from
> somewhere they have a right to be.

Here's one for you. True case.

CItizen accused of having a pistol on controlled access property directly outside his unit. According to police report, neighbor with a prior grudge against citizen for complaints to management about oversized dog barking constantly SAW citizen pointing weapon at window and door of neighbor's unit.

Police arrive. Knock on citizen's door. Citizen knowing nothing of complaint opens door. Police (all five of them) burst in, cuff citizen and interrogate concerning complaint. Citizen admits knowing of no such activity yet officers continue searching. One of the officers finds a weapon in the bedroom, brings it out, lays it on coffee table and announces "Hey, everyone. Here's where the gun was found!"

Police report suggests "weapon found in plain view."

Another of the officers happens upon a quarter ounce of marijuana in the home/office desk drawer. Calls sargeant who suggests no charges to be filed on the dope. No consent and no warrant.

Think about the circumstances: weapon from original complaint found in "plain view" then why the need to search desk drawer.

Happens more than you'd care to think. So banter as you will about the particularities of the law. Doesn't have much affect in the real world of citizen's accused unless there's a break in the thin blue line.

Word to the wise!

Charles

With the newer Uniden scanners that I have, if you hold down the MANUAL, #2 KEY, and the #9 key while powering the scanner on it will reset the memory and search limits.

Dave:

It's my understanding that the Lojack device does not emit a signal until the vehicle is reported stolen and the police notify Lojack to activate the transmitter, at which time the police track it down. In other words, if you hear it, they're already tracking it, so no need to call.

Yes, it is an excellent communications receiver! For short-wave, you obviously need "more" antenna than the telescoping whip that is supplied with it... no fault of the radio, this is the nature of short-wave. The software, although criticized by many, does a respectable job, and is rumored to be in the process of being improved in the near future. There are also some third party software options showing up!

<snip>

pretty interesting/amusing

reminds me of a story a friend (his name has the same letters as your
friend's, but in an even different order) told me about:

.........and I listened to a couple of the most amazing conversations
on the scanner. One was (as I figured it all out eventually) from
this married with children woman (T******), who was living with, but
not sleeping with, her estranged husband (G*****). She was calling
her married with children lover (S*****) to give him hell & break up
because she'd just had an hour-long conversation with S*****'s
estranged, but still living with, wife(L***), and found out S***** had
gone back to sleeping with his wife. So I believe she was calling
from outside her own place before going in to face G***** (who had
known about her boinking S***** all along anyway) and make up with
him, I guess. Theresa was acting most strange about it; her words
said she was upset & betrayed, but her voice & mannerisms said that if
S***** asked her to come over & f*** him, she would. Her voice was
light-hearted and she laughed a lot. She said she was real upset
about it, but sure didn't act it. They talked a very long time about
it. S***** was this bored, sleepy dork who offered a lot of bull****
excuses & proclaimed true undying love for T******, and that he'd only
"just recently" gone backing to boinking the wife. They both seemed
to agree the sex was great, however, and that S***** seemed to need a
lot of it. They also agreed that theirs could have been the great
true love of all time if only S***** hadn't gone & boinked his wife.
The signal was weak, but apparently unmoving, because I kept thinking
I was going to lose the signal, but it hung in there. I did lose it
once, and went on to the conversation below, but then found it again
when that conversation was done. They musta talked an hour about it.
I would have thought, if she really meant it, she'd have told him off

briefly and ended the conversation. I wasn't convinced it was really the end of T****** & S*****, although she claimed it was. Maybe they should just all move in together & have one big happy boinking family!

The other conversation was a quite strong signal of this woman who sounded exactly like a woman at work, and they spent most of the time of the conversation listening to a TV in the background. There would be several minutes of nothing but the TV, then the woman would talk a little about what the TV said. The man never said more than a few words the whole time; mostly just grunts. They're paying cellular time for this! I was hoping the guy would say her name so I could see if it really was who it sounded like.

I've been sent some updated "official" information via email and the
State Police are indeed using multiple tones in Troop G (but
apparently not in any other Troop). G-1 is using 127.3, G-2 is 146.2,
and G-3 is 167.9 Hz. This information will be corrected on my website
as soon as I have some time to work on it. One more final exam
first....

What I like are those setups for the 2-meter rigs, that are nothing more
than a BNC extension cable, and a clip to slide on top of the window
before you close it.

Went to RS and saw their 20-011 scanner, glass mount model with an extension cable ending with a BNC, just what is on the BC100XLT that I'm trying to use. May even run a permanent electrical cord like I do for the radar detector rather than the cigarette lighter cord I'm using now.
Have you seen that 20-011 RS antenna before? Anyone else care to comment?

Thanks!

A good magmount or glass mount antenna would do nicely. I have a RS
glass mount on my car and it cuts down on alot of interference.

Went and saw their RS 20-011 scanner glass mount antenna. Seems nice
but I'm still debating.

Thanks again!

>Doh! And it was going so well. But seriously:
>Are you talking about when FreeTracker picks up the same
>frequency/talkgroup a few times in a row?
>It will ignore duplicate "hits" on the same freq/group, but you can
>change that in the options.

Okay, I wasn't clear enough. By "often," I mean it either works or it doesn't, period. Not just on duplicate hits. I mean, it doesn't care if the same TG/freq becomes active right away or if another one does. It just doesn't seem to get the info from the scanner that the scanner has stopped scanning and is listening to a TG/freq.

Also, by "often" I mean "almost always."

And the S-meter doesn't work. Again, like it's not getting info from the scanner.

>
>>5. Often, when using FT to enter trunking mode, the message which says,
>>"Finding control channel" never goes away, even when the channel is found.
>
>I have heard of that before, but not experienced it myself. That's on
>my list of things to do in version 2.2

This also seems to be related to my scanner and FreeTracker not talking ... or at least the scanner to the computer.

: But I could be wrong, I guess.

What do you mean by "I'm not talking about scanning"?
All of the services I refert to within my post can be
picked up with a scanner.

I give a shit, if you like it or not, but you falsely
claimed, that in Europe cellular phone system uses
12.5kHz steps.

Fact is:

There does not exist *any* cell phone system that I know of
in Europe, that uses 12.5 kHz steps.

Yes, it can be heard with a simple telescop whip.
You don't have any chance, if you don't know the exact times, since
a pass only is about 10 minutes.

I like to add that Mir uses narrowband FM on that frequency.
Also, because of the dopler effect, the frequency will be a few kHz
highter at the start of a pass and will slowly move downward during
the pass.

Good Luck,

Friedhelm

Before doing anything, find out if your area uses Motorola trunking
systems; the current crop of trunktrackers cannot track GE Ericson,
EDACS, 400 or 900 mhz trunking, only Motorola. There are several sites
for this kind of info; do a Yahoo search and no doubt you'll pick it up.
If your area uses GE EDACS, there are programs that will allow you to
follow this system. You will need 2 radios; one with a discriminator
tap, the other computer controlled.
Do some homework before plunking down your hard earned cash!

What's a good replacement for my BC100XLT for driving in the car?

The rubber duckey attenna seems OK for stationary listening but I was curious if there might be a better one available? I generally listen to PD dispatchers.

Thanks.

Charles

Even better...

>4. Often, when the scanner stops on a freq/trunkgroup, FreeTracker doesn't
>react to it by displaying the freq/TG and doing a database lookup.
>FreeTracker doesn't do anything.

Doh! And it was going so well. But seriously:
Are you talking about when FreeTracker picks up the same
frequency/talkgroup a few times in a row?
It will ignore duplicate "hits" on the same freq/group, but you can
change that in the options.

>5. Often, when using FT to enter trunking mode, the message which says,
>"Finding control channel" never goes away, even when the channel is found.

I have heard of that before, but not experienced it myself. That's on
my list of things to do in version 2.2

>6. When I go to "BC895" on the tree and select "show scanner output," and
>the scanner stops on a freq, sometimes the scanner produces two lines of
>text; sometimes only one. When it's only one, that's when FT doesn't
>display the freq.

Yes, that's on a duplicate "hit" for the same freq/group. Go into
options, and check the "show duplicates" option.

>What's my problem? Should I be concerned about baud rate, Xon/Xoff, etc?

No no no no. Baud rate should always remain at 9600, never any
higher. The other protocol options are handled automatically by the
library I use.

>The computer is a Pentium 120, so while it's not a speed demon, it's not
>like some slow boat anchor, either.

It's perfectly fine for FreeTracker.

>Any tips would be helpful! Thanks.

2.2 should resolve the couple of things you mention. Look for it
after I get my morse code up to 20wpm and pass my Extra written test
;-)

> scanning thing, so any and all help would be greatly appreciated.

You're not so "new" that you haven't heard
about the "mod craze", though. But here is
the rule of thumb in case you missed it:

Get the scanner that comes with all the ingredients
on your priority list, including but not limited to
band coverage, memory, and speed. With exception of
the latter, you can count on not being able to hack
your scanner for those items, and speed hacks are
not recommended, even when they're possible.

In other words, make sure the scanner you buy
comes with all the essential priorities. Don't
count on or even hope for modifications to fill
the top shelf of your priorities.

Dozens of mods are possible....and in yours, even
memory expansion is possible. But not cellular;
not 800 MHz, and not other bands that otherwise
aren't there in the first place.

> 30khz steps? (I guess I'm still confusing scanning with searching)

The two are very different functions. Scanning is
the automated repetitive tuning of two or more
pre-programmed frequencies, typically what you
key in to the memory bank.

Searching is an automated service that "scans"
at preset increments all frequencies between
upper and lower frequency limits. This limit
may be user-definable or it may be embedded in
the firmware at the factory, depending on the
scanner.

In a word, you program into memory anywhere from
a few dozen to a few hundred frequencies to be
"scanned", whereas the Search function is very
methodical and thorough in sampling every freq
between the predefined limits.

You were close to your goal. In the upper left corner of the form, there is
a block that says "SITE". It's usually highlighted in a different type
color.
Click on it, and you will go to another screen that has the highlighted
word "Frequency" in the upper left corner. Click on it and you will go to
a page that lists all authorized frequencies for that site. In a large
system, there may be several different sites listed.

Sounds good.

> When attempting to scan these conventional freqs, I
> found I continually stopped on the "800" freqs programmed for the trunked
> systems.

Even in conventional mode, the trunked programmed frequencies in the
"trunked" banks will still be scanned. Just press the corresponding
number key to toggle them off and they won't be scanned.

> The only way I could figure out to skip the trunk freqs was to lock
> them out. This is sort of a pain since I had 6 banks programmed for trunking.
> Is there a simple way to skip the trunked banks?

Mentioned above. Just toggle them off.

> Any other tips?

Read the manual sections on scanning and banks.

> needed.
> Mode - CW or SSB

Only the high-end exotics have CW and SSB. That leaves AOR(AR3000A, AR8000/B, or AR5000) or iCOM(R10, R8500 or PCR1000). The AR3000A, AR5000 and R8500 are all over $1000 so I guess you can throw them out. The AR8000/B runs in the $450-$550 range. By the time you add in hardware interface and software costs, you're over your $500 limit.

The R10 is going for $429 through the end of June(promotional pricing) while the PCR1000 is about $529 these days I believe. The R10 is a handheld and you'll need a hardware interface and software as well so you'll be pushing $500 easily. The PCR1000 is only designed to be run using a computer and comes with software so the $529 is your final cost.

Good luck with your decision!

But since you are listening to images, you're only getting partial
coverage. Namely, those signals which are originally strong enough
to generate images strong enough to be heard.

> Granted the signal comes and goes, but it also does this with
> "cell capable" scanners too, doesn't it?

Not really. Sounds like you're experiencing the typical fade
which will adversely effect your reception with images. Plus
it also depends on your radio's 800 sensitivity and the antenna
being used. If you're using an external antenna, your choice
of co-ax is also important for these higher freqs.

> And the step size is 12.5 rather that 30(?) on most scanners.

That's true for most Uniden/Radio Shack models and also explains
why one can only recieve some of the original signals since the
step size doesn't match up with the 30MHz band spacing. Many
European dealers cater to the American buyers by selling the
AMPS modified units that change the 12.5kHz spacing to 30kHz.

And other scanners like AOR, iCOM, Welz, Yupiteru, etc have
user-specified step settings that can be set to 10 and/or 30kHz
thereby matching the band channel spacing.

4431. Error Message Uploading to PRO-64

Newsgroup: rec.radio.scanner
Date: 1998-05-13 00:00:00 UTC
From: foresterNOSPAM@usit.net
Message-ID: <355a8450.834018@news.usit.net>
Source record: 160722

I keep getting a "2 Error" message when uploading to my PRO-64. I know that there are no duplicate frequencies in my data file, and don't see any frequencies that are obviously out of range.

It looks like everything uploads fine, but the message still bugs me. Does anyone know what this message means? Are there other error messages produced by the PRO-64?

On another subject, are there any "undocumented" keypad "tricks" for the PRO-64?

Thanks,
Jack

If guns were not banned I am sure scanner won't be banned either.
Scanners can save lives and are needed in emergencies. Civilians can
play a big role in the safety-net of our society. Can you just see us in
one big line turning in our scanners once they are banned. Not likely.
Taking scanners out of the hands of civilians would be a big mistake
that the athorities will come to regret. Granted some people abuse
scanner priveliges, but they are in a great minority. Scanners are a
much needed device and make us aware of whats going on in our
surroundings (robberies, fires, closed roads, dangerous situations,
trees down, electricty lines down, airport closures, traffic jams,
accidents, floods, tornados and emergency communications when there is
no power. etc.)

You need the ftp address? I suppose you are talking about the "name" of the newsgroup? There shouldn't be an ftp address associated with the newsgroup, not directly anyways. FTP = File Transfer Protocol and is used to send files from one host to another...

If you are looking for the name of the newsgroup, it would be rec.radio.swap. ...And honestly most people wouldnt mind if you posted a FS message in this newsgroup as well.

Gary,

I've never seen a Pro27 and don't have the actual value for that VR.
I'd just try a couple different pots like a 1k, 10k, 100k, and 1M and
see what type of results you get. You should be able to find something
that works fairly well. I'd leave the other VR2 attached(if it not short
circuiting...) and that might give you easy contact to the board. I
would typically use a pair of alligator clips on the contacts and then just
try on a couple of pot's.

Good luck and hope this helps.

4449. Lojack Freq. Goes Nuts!

Newsgroup: rec.radio.scanner
Date: 1998-05-13 00:00:00 UTC
From: dpinero@pobox.com
Message-ID: <355ab486.424512221@news.mindspring.com>
Source record: 160740

I'm sitting here at home when suddenly my scanner starts "chirping"!
I get up and discover that the it's-so-usually-dead Lojack frequency
I've plugged into my police scanner is now suddenly active! It's
chirping loud, clear, and consistently. This is the first time I've
ever heard the chirp so loud before.

I want to call the cops and suggest they do a drive-thru my
neighborhood but I don't because I'm not sure that the chirping is
necessarily caused by a "triggered" Lojack system. I do a quick walk
around the block using my portable scanner and no antenna hoping to
zero in on the precise vehicle, but am unable to pick anything up
without the antenna at all. Calling it a nice try, I return to my
apartment to find the chirping gone from the base scanner as well.

Next time, I want to be able to call the cops in confidence. To this
aim, can anyone tell me whether or not something else might be causing
the "Lojack chirp" on 173.075? Could it even have been a police
cruiser "looking" for stolen cars?

Thanks!

4450. Help! Need to beat police radar gun.

Newsgroup: rec.radio.scanner
Date: 1998-05-13 00:00:00 UTC
From: Wunchun Chau <wunchun@usa.net>
Message-ID: <e#rTS7nf9GA.297@upnetnews03>
Source record: 160741

Two weeks ago my friend and I was visitng the city of Bellevue in
Washington.
We were merely following the traffic flow but we got stopped by
a policeman. He told us that we were driving 36 on a 25 speed limit zone.
I was pretty sure my friend was driving under 25 because I was looking
at the speedometer when the police car pull behind us.

Is there any way to prove the police wrong?

By the way, the police made a mistake when he wrote the ticket.
He wrote down an incorrect state name when he were copying info from
my friend's driver lincese. My friend has a Iowa license but the cop wrote
"WI"
on the ticket. Does that mean she can got out of it?
Can she just throw the ticket away?

I am willing to testify in the court that I was looing at the speedometer
all the time when we were driving along that street, will that make a
difference?

By the way, it was the last day of the month and we saw police cars were all
over
the places pulling people over. Is that a regular game or they need to fill
quota
by the end of the month?

Thanks

Chun

>>Don't confuse "Encoding" and "Encryption". As others have >pointed out
>before thay are not the same!
>
>Please explain the exact differance. I'm kinda fuzzy on it.

All digital signals are encoded. Encoding is just the use of a set of symbols, a code, to represent information. The message you are reading right now is encoded. It uses the ASCII code to define how letters and symbols are represented by a string of ones and zeros -- American Standard Code for Information Interchange.
^^^^
Encrypted signals, on the other hand, are intended to be secret. Look up the root "crypt-" in the dictionary. For secrecy you need a system that can be varied by the use of a secret "key", since you _must_ assume that the system itself, the part that never changes, will eventually be known and understood by whoever wishes to figure it out. Changing the key frequently enough to deter cracking, and distributing those changes secretly to all the users of the system, is usually a significant expense.

Many, probably most, codes are intended to be quite open and readable by anyone. Most police, fire, etc. radio traffic has no particular need for secrecy. Radio users are switching to digital systems as the technology becomes available for several good reasons other than secrecy, including better performance in noisy conditions, better utilization of bandwidth, and more flexible operation. It remains to be seen how many departments will select unencrypted digital systems for day-to-day use and thus allow ongoing monitoring by the citizens they are responsible to, and how many will choose Gestapo-like "Secret Police" mode, with the extra costs that implies, in order to free themselves from that accountability.

Check the 75 mhz band. We used to have a remote link on that freq and it was picked up by scanners in this area. hint look at your if frequency on your scanner, double it, subtract it from the frequency displayed on your scanner and you should be very close to the real frequency.

Besides holding the 2, 9, & MANUAL keys while powering on, sending 'AC'
to the data port will do the same thing IF you have your scanner
connected to a computer.

Open your load.cfg file with any text editor.
You should see 0 0 2
Change this to 1 1 2.
What this does is give the scanner and the Load program more time to
"talk" to each other.
I had the same problem uploading a lot of 800mhz frequencies. This
worked for me

I've rarely seen 535 son sale at all. Also, after what it takes to install
it, unless the scanner is cooked, I don;t think anyone will remove it for
purposes of resale. You could luck out but I think you'll save yourself alot
of work if you just purchase it from opto.

> You can try WiNRADiO at www.winradio.com

In my opinion, WiNRADiO's filters are much too wide for SSB
not to mention CW. And it doesn't really have "SSB". It uses
a BFO. These are the two reasons I didn't mention it since
it seemed of importance to the original requestor. I think
the PCR1000 would be a better choice for this type of
reception.

No. The MVT-3300 uses speech inversion. It won't do much to the
spread spectrum signal used on the 900MHz phones.

> What exactly is the benefit of the descrambling feature in the U.S.?

While not as popular as it once was, speech inversion is still used
by some agencies for "casual privacy".

>I have a Bearcat 800XLT and the greed LEDs are so dim you can't read them.
>Otherwise, the scanner is perfect. Would anyone have a fix for this
>problem, or a copy of the schematic they could email me?

From my FAQ, REPAIR TIPS: BEARCAT SCANNER RADIOS:

[...]

Symptom: Blank Display

"The BC300 scanner, and several other Bearcat models, employ
a switching type power supply stage to generate plus and
minus voltages in excess of 20 volts DC. When this
switcher fails to function, the display goes blank, but the
squelch control appears to work, and white noise can be
heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've
fixed, C98, a capacitor in series with the primary of the
switching transformer failed, causing the output of the
supply to drop below the level needed to power the display.
The switching transformer is mounted on the RF circuit
board, and is much, much smaller than the main power
transformer, which is usually fastened to the metal
chassis. The 22uF/16V capacitor used for C98 in early
BC300s was marginal, and was replaced with a 47uF/25V
capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his
BC210XW.

Paul Grohe replaced a failed C98 with a low ESR (equivalent
series resistance), high frequency, switching regulator
grade capacitor, e.g. a Panasonic HF series capacitor. He
also recommends adding a 0.1 ceramic capacitor in parallel
with C98.

I replaced the 22 uF capacitor in the switching power
supply stage of a BC210XL which caused the same symptom.
Other capacitors in the switcher stage have failed. C114,
a 4.7 uF/35V tantalum capacitor failed in at least one
BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display...."

I still use my BMP 10/60. I guess it's not much, with a very limited freq range and pretty useless Mob Phone and obsolete Police/Fire presets. But a few of its 10 Marine presets get action, and I've programmed 10 good freqs into it. . . OK, I really just like the looks of those rolling red lights on my shelf.

For livable results you need a circularly polarized beam antenna (usually 12' long or better), mounted on an Az/El rotor. Also, software is needed in order to determin where the orbiting object is.

4467. Your AR8200 thoughts (price, blocked?)

Newsgroup: rec.radio.scanner
Date: 1998-05-14 00:00:00 UTC
From: "A.Snow" <snowball5@hotmail.com>
Message-ID: <355B91B0.316BEE96@hotmail.com>
Source record: 160508
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I know that there is very little information available now on the AR8200, but I hoped to get some thoughts from you all.
Today my AR8000 arrived after a long two month wait! When I ordered my 8000 there was no talk of the 8200, that came about a month later. Anyway I am wondering if it is worth holding onto the 8000 with such a new model coming out, or if I should return / trade it in for the 8200. From what I have seen and read of the 8200 it is going to leave the 8000 behind as far as features(?) and technology (the dynamic memory banks sound super) and could lead to the 8000 being discontinued.

My main questions I would like your thoughts on are:

Do you have a thought to what the 8200 might cost? When the 8000 was new I believe it was about $800. Will the price be so high on the 8200 considering that the newest high end scanners to market have been in the $300-$500 range?

I have read conflicting reports to whether the 8200 has received CE & FCC approval. I know nothing about the CE but FCC approval most likely means a scanner with certain frequencies blocked. Will there be a US and a non-US version of the 8200 that does not suffer blocking? How are the 8000's handled now, is the 8000 the naughty (unblocked) scanner and the 8000B the US version? Are there other difference's to justify the higher price on a blocked scanner?

I suppose it is still a bit early for facts on the 8200. I have 29 more days to try my 8000 out and make a decision, hopefully between now and then someone (Rich?) will be able to answer everyone's questions.

thanks.

Who knows what he's doing? But don't expect him to be Mr. Congeniality when it comes to a review on a product from which he derives livelihood. Especially if you don't give it five out of five stars.

I have no personal nor business relationship with ANY radio manufacturer ANYWHERE in the world. I have never received a single cent for any word I've written be it on my web site or hobbyist magazines. I think that makes me a bit more objective than someone who sells the product.

> And, aren't you also selling the WiNRADiO?

That he does, which makes him quite biased and explains why he didn't care much for my writing regarding this particular radio. Funny he's never commented on the other twenty or so reviews I've announced here...

> But I really think you unfairly trashed an excellent, objective
> review.

Thank you for the compliment. And coming from someone who sells the product, I wouldn't put much faith in his objectivity. His opinion is as valid as mine but to have to accuse me of working for iCOM in this public forum... can you say "paranoid"?

I seem to remember my closing comments highly recommending the Radio Shack models with Opto boards. Oh...I guess I must be on their payrolls as well. I'm not but if that helps him sleep better at night, so be it.

4480. FRG9600.....20-950 mhz mod...anyone done it and had it work?

Newsgroup: rec.radio.scanner
Date: 1998-05-14 00:00:00 UTC
From: Greg Stahlman <kj6ko@innercite.com>
Message-ID: <355BD4DC.F26@innercite.com>
Source record: 160521

I did this mod and it works fine on the upper freqs but everything below 60 mhz is exactly 27.250 mhz off freq. In other words, if I want to listen to 50.25, I have to enter 23.000 mhz. This is NOT an image! The sensitivity is as good as the stock freqs. Did I do something wrong?

Thanks...Greg

> What else do you connect your headphone to? What do you connect
> that second wire or shield to?

Let me re-state:
10 uf positive (+) attached to pin 9 of Pro-51; negative goes to GND
(ground) of the Pro-51's (-) battery pack (this one side of the
shielded cable; the other side of the cable to jack. That jack is link
with audio cable to the computer's sound card. (Also I did try
another ground location on Pro-51 body.)

And in another method:

The headphone is connected to a jack: jack + to pin 9 and GND
to GND location on Pro-51.

There is also audio on Pin 8!

Just if you have to send your RS unit in for whatever, it will cost you at LEAST $45 (maybe more). That is 3/4 of the warranty cost if you buy one. Just think, in the 5 years from original date of purchase, if you must send off the unit again, you will be saving at LEAST #30 (not including parts).. Do the smart thing and buy the warranty. It is only $1 a month. Don't be cheap!!

> What features or capabilities does the PRO2006 offer that can't be had
> on the 2004? Is the receiver more selective? Any differences other
> than cosmetics that make an operational difference?

The PRO-2006 has a separate 6 kHz ceramic IF filter
for the AM section. It does make a difference in
aero (and CB) monitoring. That's one big difference
over the 2004 which uses just the one 15 kHz IF filter
for both NFM and AM.

Another is a slick and wicked Squelch upgrade. There
is a CMOS bilateral switch (IC-10) in the 2006's Squelch
hysteresis loop that's triggered by the MUTE gate. In
effect, the switch is open when there are no signals
breaking Squelch. This puts a high impedance in the
hysteresis loop making the Squelch tighter than a violin
string at high C. But when Squelch breaks, then the
switch closes, putting a 33-k resistor in the loop, thereby
making Squelch as loose as a goose. This one is a
more subtle difference, but it is a cool one.

Then we have speed. The PRO-2004 runs from a 7.37 MHz
clock whereas the 2006 cruises off a 12.0 MHz clock.
30-ch/sec as opposed to 20 ch/sec is a healthy difference.

Of course, the 2006 comes "stock" with 400 memory channels
whereas the 2004 has to have that diode added to go from 300
to 400 ch. But everyone does that one, so that's not a
big deal.

The 2006's CPU has the firmware for the latest
cellular bands whereas early 2004's had the 30 kHz
step set for the older, narrower cellular bands.
If your 2004's CPU is a GRE-0327A, then it is up to
modern standards. If it's a GRE-0327, then the
cellular programming is kind of dated.

There are other subtle circuit differences as well
as a redesigned IF section in the 2006, though I'm
not sure it offers any better performance aside from
the AM section with that extra filter.

The 2004 has the larger, easier to read LCD Display
and that wicked sloping tactile keypad, the likes of
which haven't been seen since. Pity......

Aside from speed, the 2004 can be fairly easily
modified to bring it up to 2006 specs, and what
with its larger display, tactile, ergonomic keypad,
and the shielded metal case, I'd give a thumbs up
to the 2004....still my favorite scanner of all time.

And, of course, it has more room inside for mods
and hacks......

:-)

All GRE-made scanners that had/have cellular
capability in the first place. Also some,
if not all AOR scanners, and possibly some
Icoms. WiNRADiO also does 30 kHz steps.

Uniden never made a 30 kHz stepped
scanner, I don't believe.

> UNITECH wrote:

> > You can try WiNRADiO at www.winradio.com

> In my opinion, WiNRADiO's filters are much too wide for SSB
> not to mention CW. And it doesn't really have "SSB".

Odd. SSB was detected for 50 YEARS using only a
BFO. Back in the olden days, crystal lattice
filters and product detectors were major luxury
items....unavailable in all but the creme de la
creme of radios. So the world used BFO's instead.
And liked 'em. For CW and SSB.......

> It uses a BFO.

Yes, it sure does. A BFO that tunes 5 Hz increments.

> These are the two reasons I didn't mention it since
> it seemed of importance to the original requestor.

"Seemed"?

> I think the PCR1000 would be a better choice for
> this type of reception.

Perhaps. If the desired reception were limited
exclusively to SSB, then perhaps. Considering that
SSB really isn't going anywhere, not even ACSB, one
might reasonably conclude that it isn't a factor
on which to bet the farm and the store.

WiNRADiO holds its own or exceeds the Icom PCR-1000
in most all other respects AT A SIGNIFICANTLY LOWER
PRICE. So it *IS* worth a mention in the same breath,
unless, of course, you are one-sided, biased, bigoted,
or otherwise slanted to Icom for one reason or another.

After all....Icom is the BIG GUY on the block and
probably merits a good sucking up now and again.

One would probably win *more favor* and crowd appeal
by sucking up to the Icom gang than to WiNRADiO. So

without a doubt, if its a popularity or political
dance you're jigging, you said exactly the right thing.

If it was to be completely objective and fair about
the whole deal, then your reply is subject to controversy
and surgical dissection; perhaps even vivisection.

WiNRADiO *is* a contender as evidenced by several global
awards. Has the PCR-1000 received any?

No.

Both of you are acting immaturely.

For a 26 yrs old and 26+ yr old, I'm very dissapointed.

I hope to see a bit of change around here. We are here to talk of radio, not how many girls I had sex with last week.

Hey Bill, any significant differences between the 2005 and 2006?

Thanks.....Roger

Hello,
Does anybody know any Russian or Airoflot freq(Mhz)?
I am going to travel there and take my scanner.
Thanks
Garcia

4509. Re: HELP with PRO 2006 squelch

Newsgroup: rec.radio.scanner
Date: 1998-05-14 00:00:00 UTC
From: parnass@marconi.ih.lucent.com
Message-ID: <6jf175$h55@ssbunews.ih.lucent.com>
Source record: 160584
Cross-posted to: alt.radio.scanner,rec.radio.scanner

The symptoms you describe can be caused by the
reference oscillator being off frequency.

The squelch circuitry in many scanners
employs a "window detector" which
checks to see if the radio is tuned "near" the center
frequency of a signal before stopping the search
and opening the squelch.

In article <4np41.21035$lw1.2812499@newsread.com>,
WILLY <willy@portup.com> wrote:

@cts.com
Organization: COMMtronics Engineering & World Scanner Report
Newsgroups: rec.radio.scanner,alt.radio.scanner

Wanting junked and non-working PRO-2004
scanners for my parts bin. Tandy doesn't
support the PRO-2004 anymore, so critical
repair parts can come only from hopelessly
broken units.

Please contact me if you have a non-working
or basket-case PRO-2004 laying around
gathering dust and taking up space.

#
Right. Except no one's going to know what you
mean if you insist on concocting your own terms.
"Scanning" and "Searching" are as succinct and
simple as it gets.....not to mention fairly widely
accepted in the vernacular.

Icom IC-Z1A manual, page 30:

Full scan: scans all frequencies over the entire band (I would assume using
whatever "step" you have set)
Memory scan: scans all memories in sequence
Programmed scan: scans all frequencies in a user programmed range

So I said band scan instead of full scan or programmed scan. Point is, I
didn't invent any terms not already widely in use, at least in my part of
the country/world.

Matthew

rmesser@no_spam.exis.net (Roger Messer) wrote:

> Hey Bill, any significant differences between the 2005 and 2006?

The PRO-2005 is essentially a PRO-2004 with
the extra 100-channels (400 total). It was
also mechanically/physically redesigned, but
retains the same electronic design as the 2004.

So in short, the 2005 is inferior to the 2004
since they did away with the metal case, large
display, and ergonomic kepad.

Not that you're lagging much if you have one;
it's still a fine radio. Just that I rank it
third behind the 2004 and the 2006. Supporting
my position is the fact that the 2005 only had
a one-year market life when it replaced the
2004 and then got replaced by the 2006. Seems
it was more of an interim version than an
intended front-runner.

FWIW, the PRO-2004/5/6 and 2035/2042 and even
the PRO-43 are all close family members, sharing
much the same design.

Rich Wells <wellsr@ibm.net> wrote:

> Greetings Fellow Hobbyists,
> I've just finished my review of the Rosetta Labs
> WiNRADiO WR-1000i receiver PC card.

....in which you said:

>" I have heard from some users who own mini tower
> PCs that this card is too long to fit inside! So
> keep that in mind, for sure.

Hearsay? Why are you reporting hearsay without
expressly calling attention to that fact? Why
should people "keep in mind" that sort of thing
when sheer objectivity can determine the TRUTH?

I have a dozen computers in my lab, all of which
can hold the 3/4-form factor AT WiNRADiO card.
Not a problem in desktops, mini/mid/full tower cases.
In fact, I have Intercept Technology's VADER card
that fits in all my computers too, and it is a FULL
AT form-factor card.

Hopefully, you won't continue to exhibit bias based
on hearsay. Go by the facts, and the fact is that
WiNRADiO comes on a 3/4 form-factor AT card. Which
just happens to fit the 16-bit ISA slots of all 286
and up PC's with exception of certain slots that
are in line with the CPU. But there is always one
or more slots capable of handling a full form factor
AT card. And WiNRADiO is only 3/4, sooooo ?????

Elsewhere, you ruminated:

> "Many will find the Spectrum Scope a great aid.
> But few people will buy this radio simply for these aspects.

How do you KNOW what people will buy and why or why not?
Are you trying to steer people in one direction or
another? Why? Do you think the radio hobby will
benefit by WiNRADiO going out of business?

Yeah, right. How's about mentioning the STARTING
price of the Icom PCR-1000 at over $600. If it
weren't for WiNRADiO, it would STILL be over $600.
At the very least, WiNRADiO drove down the price
of the Icom....and it's own, as well. So what
benefit is there to you or to the hobby by running
WiNRADiO out of business as you appear to be inclined?

I won't bother to comment on the rest of your verbose
review....after all, you are entitled to your opinions.
And you sure rendered plenty.......carefully couched
in the trappings of objectivity.

The record clearly shows you are an "Icom man",
so it is understandable how you would construe
the conclusion of your "objective" review.

You really should try to think BIG, though. WHICH
radio is the better for any given person is NOT
yours to decide. Yours is solely to report the
FACTS in an objective manner, and let the market
decide for itself which is the winner.

Even if you wear Icom baseball caps and tee shirts,
and chew Icom tobacco and Icom bubble gum, you
ought not to let that color your reviews. Unless,
of course, you're an Icom shill on their payroll
or something........ which you're not, right?

The least intrusive method would be to parallel two replacement filters on the existing IF ceramic filters in the WIDE IF of the PRO-2035. It uses +/- 110Khz filters now. Dropping another filter on each one will get you close to 25-50 KC bandwidth. TV audio will probably be OK still, but FM broadcast may suffer. If your 2035 is like the ones I've seen, the FM broadcast is just about useless anyway, due to images & overload. Look for CF1 & CF2 on the diagram. This doesn't lose much of the original functionality of the radio & if you just tack them on on the bottom of the board it is easy to reverse if you want to sell. The replacements are $5.75 each through RS parts or about $1.10 ea if you can justify a minimum order from Digi-Key.

I am one of those user. My pc can not accept a 3/4 length card. Many compatibles can not. Acer's, come Compaq's, and quite a few of the PB can not fit them.

>
>
> Hearsay? Why are you reporting hearsay without

I am guessing that you have home brew machines. Probably no machines built by bigger companies. If you did, you would understand why slim desktop machines sometimes have a hard time with the bigger cards.

Not always, my machine I am using right now, slim line desktop Acer
Acros Pentium, could not fit a 3/4 card because of were the cooling fan
for the Cpu is. It only has 4 slots, mounted Diagnal, not horizontal.

>>Are you trying to steer people in one direction or another?

Bill, isn't that what YOU'RE doing? You've written several (excellent, by the way) articles in "Monitoring Times" on IMPROVING the WiNRADiO's performance in some of the very areas of shortcoming (selectivity, sensitivity) that Rich pointed out in his review. And, aren't you also selling the WiNRADiO?
I've read, respected and utilized your work for years, and will continue to do so, I'm sure. But I really think you unfairly trashed an excellent, objective review.

>items....unavailable in all but the creme de la
>creme of radios. So the world used BFO's instead.

When was SSB invented? When did it become available for commercial and ham usage? When did SSB filters become available on (consumer level) commercial and ham receivers? I seriously doubt that you can make any sort of legitimate case for that "50 YEARS" figure.

>> I think the PCR1000 would be a better choice for
>> this type of reception.
>
>Perhaps. If the desired reception were limited
>exclusively to SSB, then perhaps. Considering that
>SSB really isn't going anywhere, not even ACSB, one

Depends on the service. SSB is hardly obsolete just yet.

>might reasonably conclude that it isn't a factor
>on which to bet the farm and the store.

If you wish to sell to those who want to listen to HF SSB, then it might be a good idea to include good SSB characteristics. It's not that expensive, after all.

>After all....Icom is the BIG GUY on the block and
>probably merits a good sucking up now and again.

Icom sucks. That doesn't mean that other manufacturers are significantly better. Schlock sells, these days. As you so often point out, Sizzle is often more popular than Steak.

>One would probably win *more favor* and crowd appeal
>by sucking up to the Icom gang than to WiNRADiO. So
>without a doubt, if its a popularity or political
>dance you're jigging, you said exactly the right thing.

Singing and dancing are irrelevant. What discriminating prospective users want to know is how the product will PERFORM under various scenarios.

>WiNRADiO *is* a contender as evidenced by several global
>awards. Has the PCR-1000 received any?

Awards are irrelevant. Performance and price are relevant.

Hello,

Could someone please e-mail me with the frequency (frequencies?) that the Florida Highway Patrol uses for their Mobile Extenders? (Officer to Car). I am in Ocala - Marion County if that makes any difference.

Please save me from having to buy a book just to get this one thing! :^)

Many Thanks!
hipcs@aol.com

Dude,

Your asking for a $1200 dollar radio(Even then without CW). Also, the
language used to control any RS-232 device depends only on the language
having that ability. The radio interface has nothing to do with it.

How can you change the step size from 12.5 to 30 khz in the cellular bands
without replacing the firmware?

: hear it, they're already tracking it, so no need to call.

: Bill Crocker

The vehicle may be reported stolen and the device activated,
but that doesn't guarentee aquisition on the part of the PD -
Assuming the chirps are consistent with a vehicle beacon,
a phone call would at least allow units to narrow the search
area.

In Los Angeles, there are chirps on the Lojack freq, but they
are relatively infrequent - I haven't paid much attention, but
I'd guess the period is on the order of a few minutes - I suspect
that is an activation signal. A continuous signal would more
than likely be a vehicle beacon.

>>know that there are no duplicate frequencies in my data file, and
>>don't see any frequencies that are obviously out of range.
>>

You were correct, Barry, I did find a stray frequency.

Since I keep my frequencies on an Excel spreadsheet, and I am kind of
a computer geek, I wrote a formula to find frequencies that are out of
range for the PRO-64. In case anyone is interested, it goes like
this:

=IF(OR(AND(B3>=29,B3<=54),AND(B3>=108,B3<=174),AND(B3>=380,B3<=512),
AND(B3>=806,B3<=824),AND(B3>=849,B3<=869),AND(B3>=894,B3<=960),B3=0),"","X")

Of course, you have to adjust the cell references. This formula can
be used to put an "X" in a cell next to any invalid frequency, making
it easy to spot.

Jack

How can they not? What is the problem? I have
a Compaq in my shop right now that can hold a
full AT card. Acer's I'se seen before could, too.
3/4 for-factor cards are really no big deal. Lots
of peripheral add-ons come on 3/4 cards.

> He was being truthful.

Hearsay is NEVER "truth". It is only hearsay.

> > I have a dozen computers in my lab, all of which
> > can hold the 3/4-form factor AT WiNRADiO card.

> I am guessing that you have home brew machines.

Bzzzt. Wrong answer. Next please.

Well, I do have *some* home-brews, yes. I won't ever buy
another production computer. But still, I have two Dell's,
one VTech, one Zeos, and a couple of off-brands.

> Probably no machines built by bigger companies. If you did,
> you would understand why slim desktop machines sometimes have
> a hard time with the bigger cards.

Dell isn't a "bigger company"? Ha ha ha ha ha.....

I only work on and build computers, pal. "Understand"?
Ha ha ha ha ha. Yes, I understand that some IBM PS/2's
have to take an adapter-riser for full length cards. So

do other slimlines. In any event, it is a non-hype issue
if an AT card won't fit a certain computer. It isn't
an emotional issue. It fits or it doesn't. And it is
easy to tell.

> Not always, my machine I am using right now, slim line desktop Acer
> Acros Pentium, could not fit a 3/4 card because of were the cooling fan
> for the Cpu is. It only has 4 slots, mounted Diagnal, not horizontal.

Soooo you are an exception to the rule, then. Even so,
if you were "inventive", you could make it fit.

> > > "Many will find the Spectrum Scope a great aid.
> > > But few people will buy this radio simply for these aspects.

> Again honest openion, who are you to argue.

No, it isn't an "honest opinion". Not from someone who
pretends to be a "force" in the hobby and in the market.
At best, it was a crudely expressed opinion that has the
effect of "steering".

> Myself I am a Dell person, two machine could be vitually the same. I
> would still vote the dell better. Why because they are a better
> company. Icom is a name that has been there. Why not lean towards a
> company that has a good rep?

I used to be a "Dell man", too. Several factors
came together to force me to re-evaluate my stance.
But never mind that....it isn't germane to this topic.

No doubt about it, Dell makes some of the best
computers in the industry just as Icom makes some
of the best radios.

But the bigger a company gets, the more influence it
has over the market....which can be good....but it can
also have the effect of stifling competition. Even if
WiNRADiO was worthless, it had the effect of driving
down the Icom's price by a hundred bucks or more. If
Mr. Wells is successful at driving WiNRADiO out of
business, then the Icom price will go back up, perhaps
even higher than ever.

Some writers feel that if you can't say something bad
about a product or company, then you shouldn't say
anything at all. Mr. Wells seems to have that tendency
with exception of his beloved Uniden and Icom, neither
of which, by the way, have this hobby's best interest
truly at heart.

Icom plays to the high end scene and Uniden plays to
everything else. Good thing Radio Shack competes
with Uniden, even though that very competition seems

to have been diluted of recent years with lots of
Uniden products in the RS inventory.

Still, GRE helps keep Uniden at bay....and it is a
damn good thing. For "us".

> review.

Well, it wasn't "objective" from a professional perspective.
It was riddled with hearsay and opinion, and glittered with
numbers that pretend to be "facts".

Just telling it like I see it. And another way I see
it is that Icom stands on its own merits. But they
would just love it if WiNRADiO went down the tubes.
THAT would NOT be good for the hobby now would it?

> this newsgroup?

Sure.

But, would you like to buy an Icom? I'll
sell you one if you prefer it over WiNRADiO.
No skin off my nose.

I just hate to see people chewing Icom bubble gum
and trashing the new guys on the block, especially
in a non-factual, emotional sort of way.

The little guys help keep the big guys from
taking over........

I like to see fair competition and a variety of
offerings to the market. At reasonable prices.

Don't you?

So how about an Icom instead?

Hello!

Wanted: Copy of Motorola P50 (VHF/Lo) handeld Service Manual.
I'm trying to re-crystal a pair of these radios and would like the proper technical details. Copies would be appreciated also. Thanks!

>Just telling it like I see it. And another way I seeit is that Icom stands on its own >merits. But they would just love it if WiNRADiO went down the tubes.
>THAT would NOT be good for the hobby now would it?
Bill,
You seem to be suggesting that an Icom product is automatically above reproach just because it says "Icom" on it. I don't agree.
I do think it's perfectly logical (and objective) to compare the IC-PCR1000 with the WiNRADiO, since they are the only two similar products currently available that I'm aware of (not counting the Kachina ham transceiver) which are computer peripherals. I also think it's appropriate to bring Radio Shack into the discussion, in the context of dealing with computer CONTROL of radio devices.
What's really throwing me here is your implication that Rich Wells somehow doesn't have the proper authority to express an opinion. Personally, I find it useful to get the perspective of another hands-on user, irrespective of whether he or she qualifies as what you consider "professional".
No problem here with you telling it like you see it. I hope you AND Rich will continue doing that for a long time to come.

> excelent unit from CTP. Here's a link to thier site.

The 'excellent unit' with 'a lack of filtering' so you can decode 'some
of the split band as well' ..... ???? ;-)

Build your own (de-)scrambler (without a lack), just for a couple of bucks.

Download the PCB-layout file at:

http://www.qsl.net/pa3eik/descrambler.htm

And if you need a software-solution:

http://www.lpcom.com/download.html

Available for download is a real-time Speech Inverter system for Windows 95
or Windows NT and a full-duplex sound card. The inversion point is variable.
Usually, it would be used in conjunction with a mixer control, such as the
mixer that comes with Windows, to mute the passed-through audio so that the
processed audio can be heard clearly. Connect the phone/tape output of the
radio to the mic/line-in input of the sound card. An attenuating cable may
be necessary, especially if the radio's audio is connected to the micro-
phone input of the sound card. These can be found at your local Radio
Shack. When you want to decode an inverted signal, start the inverter.
Adjust the slider until the audio is understandable. Mute the mic/line-in
input on the mixer control to remove the unprocessed signal.

This software is provided for demonstration/education
purposes only and should not be used for illegal purposes.

>What's really throwing me here is your implication that Rich Wells somehow doesn't have the proper authority to express an opinion. Personally, I find it useful to get the perspective of another hands-on user, irrespective of whether he or she qualifies as what you consider "professional".

I thought the review lacked the dispassionate objectivity that a professional journalist or reviewer (i.e. someone who makes a living at reviewing products for a magazine or newspaper) would bring to the assignment but overall, I think it was a very good effort. I thought he did a thorough job and the review told me everything that I wanted to know and some things that I couldn't care about too. Certainly, he provided a similar level of analysis that you will in the average magazine for enthusaists. read Stereo Review, Video or something similar and you'll find the reviewers will make personal comments on the products they're reviewing, at least at a level that would be of import to a regular reader and user of those products.

I am also impressed that he buys this products to review. The reviewers that really make me wary are the ones who accept products from advertisers for review. That alone makes me trust that his motivations are good.

In fact, I would give more credance to Wells' reviews than I would to any in Pop Comm or Monitoring Times. The reviews in those two pubs are woeful and evidently geared to sucking up to the advertisers.

Hi,
It seems that you know alot about winradio.. I am really a software
developer not a radio buff. anyway, I got my radio yesterday, threw the
antena out the window and gave it a rip. I was only able to get a few
frequencies. I hooked up an antenna that I bought that has the range of
25mhz to 1000 mhz.. still couldnt get much..

A. Could there be something wrong with my radio ??

B. Could it be as simple as puting an antenna up high ?? I am surrounded by
trees in the woods. I live way out in the country..

C. Are these radios just weak ? I mean even if I tune into a FM station, its
is weaker than if I just used a regular radio....

What could I be doing wrong??

Message-ID: <355c9ae9.990758@news.mindspring.com>
Source record: 160427
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Let me begin this post by stating that I am in no way affiliated with either Icom or Rosetta Labs (the makers of WinRadio). Nor do I have any "hidden" political or non-political "agendas". Finally I have no allegiance to any manufacture of radio equipment or to any "group" or "camp" on any of the newsgroups.
Finally I not out to discredit anyone or any product, only to state my PERSONAL opinions.

Whew...
That being said, (and in order to clear the air and make SURE Bill Cheek understands where I am coming from) I believe I am ready to state my opinions on the PCR-1000 and respond to the appended post.
I would highly recommend the PCR-1000. I have owned one for approximately 5 months and use it on a daily basis. While the software that controls the radio has some limitations, the hardware is SUPER.
The shipped software certainly looks nice and has many great functions, but there are some drawbacks that prevent me from giving it a rating of more than just "ok".
However, there are at least three 3rd party software packages that address these problems and allow you to get even more out of the radio.
Go to a search engine and look around, there are a couple of independent reviews that should help you make and educated choice. I had a choice and did a lot of research before going with a PCR-1000.

And finally let me just take a second to comment on sorry state of these scanner based newsgroups. If you are new to the Internet you will find that it takes a very thick skin to post anything these days. You must be prepared for the worst because it WILL come out as soon as someone disagrees with ANYTHING you say.
That is the reason for my response to this post. My opinion matters just as much as anyone else as long as I ACTUALLY HAVE SOMETHING USEFUL TO ADD to the discussion. If I don't I keep my mouth shut. I own a PCR-1000 and my next door neighbor owns a WinRadio. And guess what Bill, we haven't shot each other yet and are actually good friends. What a concept!

Here is what ticked me off:
Carlos posts the following:
>I'm looking for a scanner that can be controlled by a computer. It
>must be controllable using standard C/C++ Dos or Windows.
>
>Cost - in the $500 or under range

>Bands - Only need the 440 MHz band, 145MHz a plus. Anything else not
>needed.
>Mode - CW or SSB
>
>Number of channels, etc is flexible.
>
>Thanks!
>Carlos

See where Carlos states SSB. Remember that.

Then Rich Wells responds with a list of receivers that will do the job but did not include the WinRadio. (I can just smell a conspiracy brewing...).

Next UNITECH writes:
>You can try WiNRADiO at www.winradio.com

Okay cool.
Rich Wells then responds with:
>In my opinion, WiNRADiO's filters are much too wide for SSB
>not to mention CW. And it doesn't really have "SSB". It uses
>a BFO. These are the two reasons I didn't mention it since
>it seemed of importance to the original requestor. I think
>the PCR1000 would be a better choice for this type of
>reception.

Great. Now up until this point things are going great. We only have FACTS and Rich?s clearly stated OPINION up to this point. But wait what is this... Uh oh!! Rich didn't choose his words correctly.. Rich, you should have NEVER said "seemed of importance". Now regardless of the fact that the original post stated VERY CLEARLY that he wanted SSB, trouble is coming...

Bill Cheek then posts of his more recent "classics":
I will post the message in it's entirety so that we are sure that are no "cover ups".

>>> UNITECH wrote:
>> > You can try WiNRADiO at www.winradio.com
>> In my opinion, WiNRADiO's filters are much too wide for SSB
>> not to mention CW. And it doesn't really have "SSB".

>PRICE. So it *IS* worth a mention in the same breath,
>unless, of course, you are one-sided, biased, bigoted,
>or otherwise slanted to Icom for one reason or another.

Yep, there is no doubt that Rich is one-sided, biased, bigoted AND to top it all off slanted to ICOM.
Come on, give me a break. Why don't you go to Rich's Web page a have a look for yourself (http://www.qsl.net/n2mca/). The man owns almost every radio currently available. And what is this?? He actually owns BOTH a PCR-1000 and a WinRadio. He must want to strangle HIMSELF.....

And then to top it off Bill writes:

>After all....Icom is the BIG GUY on the block and
>probably merits a good sucking up now and again.
>
>One would probably win *more favor* and crowd appeal
>by sucking up to the Icom gang than to WiNRADiO. So
>without a doubt, if its a popularity or political
>dance you're jigging, you said exactly the right thing.
>
>If it was to be completely objective and fair about
>the whole deal, then your reply is subject to controversy
>and surgical dissection; perhaps even vivisection.

I am glad Bill brought this to my attention. You see Rich's post had so much "croud appeal" that I was ready to start sending him all of my current savings and my entire 401K plan. And that "popularity or political dance" had me sending my girlfriend over to Rich's because of the success he has in implementing his conspiracy.

So Bill, I am subjecting YOUR reply to a "surgical dissection; perhaps even vivisection" because I am SICK of seeing you bully people around on this (and other news groups).

So folks, make up you own minds, use tools like www.dejanews.com to back up you arguments, and try not to degrade to name calling or intimidation (which I am sure will be following this post).
I am taking a stand for the good of the newsgroups. I want to see them return to a place where we have friendly discussions and useful exchanges of information.
Good day...

Thank you. It was not a particularly easy review to write; it took quite some time to test and write up everything I did that went into the review. I do not think I put any more "passion" into it than anything else I have written on other radios or accessories.

Some people seem to think the review is unduly harsh but just in a few areas. I'll have to go back and read the entire article myself and consider the entire context rather than checking the spelling, grammer and correctness(to my notes) which is what I concentrate on just before putting it to the web.

The main ideas I meant to get across, and thought I did, was that this radio was easy to use(functionally), was overly sensitive(and easily overloaded), frustrating to use on VHF/UHF due to the widely varying noise floor, is not selective enough(especially where it matters on HF) and requires some effort in interference reduction which one does not usually have to worry about with the "typical" receiver.

And for the record, I am a hobbyist. I am not a professional in the sense that anyone pays me to write a review, nor do I receive ANY compensation nor do I get any of my radios for trial use(except those to Scanning USA which to date has been one radio which I already owned; the Alinco DJ-X10). I also sell nothing with regards to the hobby either.

I am here to provide my opinions free of charge. I say what I like and dislike. From these, and my experience with other radios of a similar nature(which most people can't afford to buy and compare personally), I offer my recommendations.

> I am also impressed that he buys this products to review. The
> reviewers that really make me wary are the ones who accept
> products from advertisers for review. That alone makes me trust
> that his motivations are good.

That bothers me too at times but I think most reviews I have read, when I contrast them to mine, are similar. Granted, some issues are candy-coated at times and that's because of the

usual feedback between magazine and manufacturer. With my reviews, they are my views alone and have not been edited in any way, shape or form to appease anyone.

And the only motivation I have is to provide the information necessary(and is lacking in many other reviews for whatever reasons) for other hobbyists to make a more informed decision. Between my reviews, magazine reviews, and the Internet, today's hobbyist is in a better position to make a choice which will make them happy and help the hobby prosper.

> In fact, I would give more credance to Wells' reviews than I
> would to any in Pop Comm or Monitoring Times. The reviews in
> those two pubs are woeful and evidently geared to sucking up
> to the advertisers.

I see this occasionally but for the most part, I think the reviews are not given enough page space too adequately cover the numerous aspects of today's complex receivers. I try to deliver as much info as possible from my own needs as well as the large amount of feedback I get from people who read my reviews and offer up suggestions for what they'd like to see. I have accomodated much of this type of information which goes into making this process even more useful to the hobby participants as a whole.

Hello to all...

I have for sale the following items...email to kb8ixp@lightstream.net with questions, etc. Thanks...Sean

01 Yaesu FT-2200 VHF mobile 2-meter, complete. Physical condition 8/10. $150.00

02 Midland 70-056c VHF Low Band mobile radio. Currently programmed to 6 meter ham band. Commercial, 80 channels, 110 watts, remote mount. Comes with all accessories, and service manual. Physical condition 8/10. $175.00

03 Icom IC-4SAT UHF 70cm HT. Modded for wideband. Comes with end cap, antenna. Physical condition 5/10. $100.00

04 Icom IC-R1 Wideband HT scanning receiver. Covers 0.100 to 1300 MHz, continuous in WFM, NFM or AM in 100 channels. Comes with end cap, antenna, belt clip. Physical condition 7/10. $200.00

05 Uniden Bearcat 760-xlt mobile scanning receiver. Covers 29 to 956 MHz, but not 175-406 and 512-806, and also cellular is blocked. Includes onboard CTCSS decoder, RF amp. Physical condition 5/10 due to tape residue on the exterior. $125.00

06 Radio Shack Patrolman PRO-2026 mobile scanning receiver. Covers 29 to 956 MHz, but not 175-406 and 512-806, and also cellular is blocked. Service Scan. Physical condition 8/10. $100.00

07 Radio Shack PRO-2032 base scanning receiver. Covers 29 to 956 MHz, but not 175-406 and 512-806, and also cellular is blocked. 200 channels in 10 banks. Physical condition 7/10. $125.00

Terms of sale:

All equipment is in perfect working order at the time of sale unless otherwise specified. The seller implies no warranties. The seller is not and will not be held responsible for damage to equipment by shipper or by buyer.

Prices are firm. Sales are made by prepayment or COD only. Buyer chooses shipper from UPS, FedEx and US Postal Service. Buyer pays all shipping charges and COD charges. If buyer prepays by personal check, the item will not be shipped until the check clears.

I see you were careful in using the word IF. It turns out, that here in
california, some guns are banned. No, they didn't come to people's doors
to pick them up, but don't be caught with them I'm speaking of the
so-called assult weapons, which, as more knowledgable people know, are not
assult weapons. The first demand was that they had to be registered. Then
there was an amnesty period, and last, if one is caught with one, not
registered, confiscation and fines. Believe it or not, the radios are not
far off.

<snip>

I realize Rich Wells hardly needs the support of a newbie like me...

And I'll try not to be biased by the fact that he's carried on an extensive email correspondence with me, helping me to choose my first scanner. Or that his website has been an invaluable resource in this endeavor.

In my brief experience with internet scanning resources, it's become apparent that Mr. Cheek is a 'somebody' in hobby radio. Having learned the hard way from other groups that flame wars are an absolute waste of time, I've not downloaded any of the messages in which Mr. Cheek's name figures. Until now, I've had no opinion of the man.

I haven't the knowledge or experience to truly evaluate the Wells review. However, it contains descriptive facts, test results, and opinions about the observations. Any rebuttal to the conclusions drawn should point out errors in fact or measurement or provide alternative opinions based on Mr. Wells' observations.

In his message, Mr. Cheek offered a single fact - the WinRadio fits in all his computers. There was no other information which helped me evaluate the review or the product under review. No technical data were offered to back his opposition to Mr. Wells' conclusions.

In other words, Mr. Cheek's comments did nothing to enhance my knowledge about or enjoyment of this hobby. I expect more than unsubstantied and offensive ad hominem attacks from a supposed authority.

Mr. Cheek has no credibility with this neophyte. I'll ignore any future posts from him.

Hi,
I'm trying to enter my friends' Ham repeater freq., and the scanner changes it when I hit enter. I'm trying for 224.580, and it chooses 224.575. Why is it doing this?

Would a PRO-2006 accept this exact freq. in memory?

How about a Bearcat 9000xlt?

Thanks,
Bob

>a policeman. He told us that we were driving 36 on a 25 speed limit zone.
>I was pretty sure my friend was driving under 25 because I was looking
>at the speedometer when the police car pull behind us.
>>>>>>>>>>>>>You need to have the speedometer calibrated / certified to have the reading
accepted in most courts.
>Is there any way to prove the police wrong?
The way radar is done, when done properly, is this. The officer makes
a estimate on the speed of the vehicle in question, THEN, he utilizes
the radar gun to determine the accuracy of his estimate.
After several years of speed enforcement, an offier can get very good
at such estimates.
>By the way, the police made a mistake when he wrote the ticket.
Cops are human and do sometimes make mistakes.
>He wrote down an incorrect state name when he were copying info from
>my friend's driver lincese. My friend has a Iowa license but the cop wrote
>"WI"
>on the ticket. Does that mean she can got out of it?
You had best check on that issue with the prosecutor from the
jurisdiction it was written or a competent attorney. The state of
license is not at issue, only the question of was there excess speed
or not.
>Can she just throw the ticket away?
Yes she can throw it away. It may or may not come back to haunt her
through a situation known as reciprocity. That is an agreement between
most states to get their motorists to answer summonses in other states
(answer, not plead guilty, just answer) with the understanding that if
you don't the state may ask your state to suspend your driving
priviledge.
>I am willing to testify in the court that I was looing at the speedometer
>all the time when we were driving along that street, will that make a
>difference?
Possibly. Depends on how unbiased you appear to the court.

>By the way, it was the last day of the month and we saw police cars were all
>over
>the places pulling people over. Is that a regular game or they need to fill
>quota
>by the end of the month?
If enforcing speed limits with the eventual result being to save lives
and property is a game, you bet. It is a very good game with everyone

being a winner.
Quota.....Most states don't need to have such an outdated system to get sufficient stats for a given month. there are plenty of violators out there willing to provide the ingredients for writing as many summonses as you want to per month.

You might have guessed it. I spent 21 years as a police officer, so I guess my response appears a bit biased because I saw the results of speeding and other violations far too many times in my career. I retired and don't look back but i would like to thinbk that one or two people were spared accidents because of uniform guys (and girls now too) out there keeping everyone in cars on their toes.
>Thanks

Did you use this modification or not?

http://www.geocities.com/CapeCanaveral/8516/expand.htm

I'm planning on performing this modification to my FRG-9600.
I'll post the results.

-rbw
PS. I've already performed the modification for discriminator
output and it works just fine for receiving digital modes like
POCSAG, etc.

4589. WTB: A couple of air variable capacitors

Going to put up an inverted EL for 160 meters and I am in need of a couple of air variable capacitors of around 300-400pf each. Smaller value ones will also be considered as I can just parallel up what I need for more capacitance. Close spacing should be ok as I will be running under 100 watts. Please email me with what you have and your asking price.

I just installed a hamcomm-based slicer interface on my PRO-2006. I connected it to what I _thought_ was the discriminator output - IC-2 Pin 9.

I have tested the interface with POC32 version 2.05, Trunker version 3.4.2, Etrunk, MDTSTUFF, and MDTW1234 and can see no sign of any data reaching the computer. Any troubleshooting hints?

> changes it when I hit enter. I'm trying for 224.580, and it chooses
> 224.575. Why is it doing this?

Hi Bob,
It's rounding the frequency to be an even multiple of 12.5kHz
which is the step size used for that region(look in your manual
on page 44). See the second "Notes" on page 20 as this explains
it also.
Even though the radio isn't exactly on frequency, you should
still be able to hear it since it is so close to the desired
frequency(5kHz off).

> Would a PRO-2006 accept this exact freq. in memory?

Yes.

> How about a Bearcat 9000xlt?

Yes.

I would think about whether you want to get images of phone calls at
1500mhz, images of pagers, images of trunked
systems in your phone frequencies, whether
you want wandering birdies, a keyboard with symbols that rub off, a lcd that
scratches with a drop
of a hat, a rotary knob that comes back to the same channel after 4
clicks..... and whether the 8200 will be any better...

If you can return the 8000 and wait for the 8200. Just from the specs I've seen it's going to be nice. Even if you wait and find out that the 8200 is crap, which I doubt, you can always buy the 8000 again.

Source record: 160527

Thanks to all who replied. I must have an early version of the manual, because it does not mention bank scanning in the conventional area at all. It only mentions banks in the trunking section and then only in reference to scan lists if all banks are trunked. I just re-read the whole thing and it never once mentions how to enable banks in conventional mode. Just shows you how valuable these newsgroups are.
Again, THANKS!
Dale

4612. Re: Want advise on Trunking Scanner

I have had a Uniden BC-235XLT Trunktracker handheld scanner for about 4 months now and I really don't have anything bad to say about it. It works great as a trunktracker and as a conventional scanner. It also comes with two battery packs and a charging cup for the extra battery. The Radio Shacks don't. Really is a great scanner.

DON'T think that the DB-25 port on the back of a Mac is a serial port - it
isn't! It's the SCSI port!

4615. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.scanner
Date: 1998-05-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6jgqf4$lrs@news.Hawaii.Edu>
Source record: 160531
Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Greg,

Do you have an outside storage room, perhaps on a patio or balcony? If so, you can use a groundplane or discone on a five-foot mast, supported by a tripod mount, and hide the whole assembly in the storage room. It will be a great improvement over the stock antenna.

Unless you listened to this on your scanner, what does it have to do
with this ng. There are plenty of ng's your concerns can be posted on,
and those that care to listen to them will do so there.

I am in need of one of those simple el Cheapo inline SWR bridges. The rectangular unit with SO-239's on each end and some of them could even be used as a FS meter. They had one knob to set the forward power and then a switch to read reflected. I need one that will go up into the VHF band and as I recall most of these units would read from 3-150mhz. They sold for around $19.95 new. Anyhoo that's what I need. Email me with what you have and a price.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip

using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna

Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency

lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the

scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 fee for 200 hours use of the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83
and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal

chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his BC210XW.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a

flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the

microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd

electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1997 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150

148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Minimum Volume Setting

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant

max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

JULY 1998

Jul 12 (Sun), Peotone, IL. Kankakee Area Radio Society. Will County fairgrounds. info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. tel. 815-939-7548, E-mail: k9nr@juno.com.

Jul 19 (Sun), Sugar Grove, IL. Fox River Radio League. Waubonsee Community College. For tables, tickets, and information: contact N9UZC James E. Von Olnhausen, n9uzc@amsat.org, (630)-879-3042, FRRL, Box 673, Batavia, IL 60510-0673. (good, small to midsized hamfest. Modern rest-room facilities. - AJ9S)

AUGUST 1998

Aug 2 (Sun), Peotone, IL. Hamfesters Radio Club. Will County fairgrounds. info: Dave Brasel, NF9N, 6933 West 110th St., Worth, IL 60482. tel. 708-448-0580 (Usually an excellent hamfest - AJ9S).

Aug 23 (Sun), Woodstock, IL. Tri-County Radio Group. McHenry County fairgrounds. info: Bob Grosse, N9KXG, PO Box 3107, Skokie, IL 60077-6107 tel. 708-944-0500. E-mail: tcrg@hotmail.com, http://quality-enterprises.com/tcrg/ (fairly good, small to mid sized hamfest - AJ9S).

SEPTEMBER 1998

Sep 19, 20 (Sat & Sun), Peoria, IL. Peoria Area ARC. info: Jim Williams, N9HHU, Box 3508, Peoria, IL 61612-3508. tel. 309-692-3378. Fax: 309-698-8643. E-mail: jimeoc@worldnet.att.net, http://www.w9uvi.org

Sept 26, 27 (Sat & Sun), Grayslake, IL Chicago FM Club. Lake County fairgrounds. info: Mike Brost, WA9FTS, 5127 North Monterey Ave., Norridge, IL 60656-3245. tel. 708-457-0966 (the biggest and best hamfest in northern IL - AJ9S)

OCTOBER 1998

NOVEMBER 1998

NOTES - Computer Central and Giant Computer shows

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

Giant Computer shows are usually held at the Orland Park
Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or
at the DuPage County Fairgrounds, County Farm & Manchester
Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM
- 3 PM. To get on the mailing list or get more information,
call (847)974-3123. See http://www.gicancomputershow.com

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $49 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign
on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the
actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to
him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the
"instructors". Mystery solved; I had been monitoring the
customer training center for a large computer manufacturer.
The training center has hotel rooms and dining facilities
to accommodate students from out of state. As a
convenience, shuttle van service is provided to local
shopping malls.

Summary

Through books, government records, and radio clubs, scanner
listeners can make use of frequency information compiled by
others. Two-way radio users often fail to identify their
transmissions properly, making it more difficult for
listeners to know who they are monitoring. By examining
radio equipment labeling, and monitoring and taping
transmissions, scanner enthusiasts can unearth new
information.

archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com/support_electronics/2849.html. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic

front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than 70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. This article describes a few of the FM receivers in my collection, and other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Mar 1998 - RELM MS-200 mobile |
Apr 1998 - RCA RP-6150 portable |
May 1998 - Radio Shack PRO-2050 base Trunktracker |
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display |

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested.

Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks,

not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT |

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be

arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel | portable with 10 priority channels. Unique feature tells | whether a given frequency has already been memorized. | Generous coverage of conventional bands, including | commercial aircraft, but no 800 MHz. Decent leather-like | case. Slide-on 550 mAH NiCd battery pack. |

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT | through Scanner World. Very good 200 channel version of | BC100XLT portable scanner but includes 800 MHz band. 10 | priority channels. Unique feature tells whether a given | frequency has already been memorized. Decent leather-like | case. Slide-on NiCd battery pack. |

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable | scanner which is a smaller successor to the BC200XLT. | Includes 800 MHz band. 10 priority channels. Service |

Search, including WX. Up to 10 frequencies can be locked | out during conventional search, 20 frequencies from Service | Search. Unique feature tells whether a given frequency has | already been memorized. 10.8 MHz and 450 kHz IFs, with | images 21.6 MHz away. 4 cell BP-120 internal NiCd battery | pack. Marketed as BC230XLT with two BP-120 battery packs | and CRX-120 dual charger. See "The BC220XLT/BC230XLT | Portable Scanner," by Bob Parnass, AJ9S, in Monitoring | Times, April 1996. |

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT. |

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with | 300 channels in 10 banks. Can scan or search in | conventional or trunked domains but not at the same time. | Scans Motorola Type I, II, IIa 800 MHz trunked systems, but | only one trunked system at a time. Programming Type I and | IIa systems requires knowing the Fleet Map ahead of time or | else using exhaustive trial and error. A query feature | identifies duplicate memory channels. Very fast scan and | search rates. Scans 64 channels/sec and skips empty | channels. Service search. Data skip. Triple conversion, | 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and | intermod immunity. Fairly good audio. See "The Uniden | Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring | Times, July 1997 or an on-line version at http://www.grove- | ent.com for a review which includes quantitative test | results. |

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older

Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as

federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during

search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. * Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY |

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby

SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK |

PRO-24: 1983 vintage. Only 4 channels in this crystal | controlled portable. Covers the three basic bands, but no | aircraft. Easy to obtain batteries and crystals. | Characteristic Radio Shack squelch problem, fixable by | changing one resistor. All-plastic case larger than Bearcat | Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," | by Bob Parnass, excerpted in the "Technical Topics" column, | RCMA Newsletter, February 1984. |

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 | crystal controlled portable bearing the same model number.) | Very good portable made by for Radio Shack by Uniden. 200 | channels, very fast scan/search. Good display. Covers all | TV channels, but spectrum adjacent to cellular phone band is | censored which prevents monitoring parts of some trunked | systems (e.g., IL State Police district 4). Up to 50 | frequencies can be skipped during search. Limited image | rejection causes 929 MHz paging interference in 170 MHz | range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. | Audio suffers from small speaker. See "The Radio Shack | PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, | in Monitoring Times, August 1995. |

PRO-30: 16 channel programmable portable with aircraft band. | Good frequency coverage. Extra controls on top allow | control of SCAN, MANUAL, and PRIORITY functions while worn | on belt. Good belt clip. Low audio output. Plastic case | prone to break at BNC antenna connector under severe use, | vs. metal frame in Regency HX1000. High price, no discounts | or sales yet. I had 6 or 7 PRO30s, having to return them | several times during the 1 year warranty, although other |

owners have had little or no trouble. Troubles included | oscillation in IF stage, no UHF band reception, case broken | around base of antenna connector, etc. |

PRO-34: Portable scanner with 200 channels and 800 MHz | coverage. Ten "monitor" channels. Operates from AA cells. | Slow scanning, low audio output, and chintzy plastic case | detract from an otherwise good performance. No decent | leather case available from Radio Shack. If you need a | portable with 800 MHz, get a Bearcat 200XLT. If you can't | get a 200XLT, get a PRO-34. |

PRO-43: Very good portable made by GRE. First Radio Shack | portable with up conversion, and 222 MHz ham and 225 - 400 | MHz military air band coverage. 200 channels, single search | range. Small, convenient size. Muffled audio. Speakers in | early units known to fail and more powerful speakers were | used in later units. 800 MHz band coverage fully restorable | in early units by removing diode. Uses same 6 cell battery | tray as other high end GRE portables. Subject to | interference in 160 - 162 MHz range. |

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or | provision for mobile operation. Good little scanner despite | limited frequency coverage and Spartan lack of frills. | Crisp squelch action and good audio, helped by a front | mounted, vertical speaker. |

PRO-60: 1995 vintage. Very good portable made by GRE. 200 | channels, single search range. Similar features and same | IFs as the PRO-43 it replaced but the PRO-60 has wider | frequency coverage and crisper audio. Covers 75 MHz and | commercial FM broadcast bands. Improved Direct search can | be stepped manually in single steps. Uses same 6 cell | battery tray as other high end GRE portables. Railfans take | note -- the PRO-60 and PRO-43 are subject to interference in | 160 - 162 MHz range. Draws 100 mA while scanning. See "The | Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in | Monitoring Times, September 1995. |

PRO-62: 1994 vintage. Good portable 200 channel scanner | using up conversion. Similar to PRO-43 but no military air | band, different upper frequency limit, and slightly | different IFs. Selectable AM/NFM modes. Better intermod | immunity than PRO-43. See "The Radio Shack PRO-62," by Bob | Parnass, AJ9S, in Monitoring Times, February 1995. |

PRO-64: 1997 vintage. Good portable 400 channel scanner | using up conversion. Replaces PRO-62 and has many more | features. Selectable AM/NFM modes but fixed step sizes. 10 | search banks which can be cascaded. Auto store saves unique | frequencies found during a search. Frequencies can be |

loaded using a computer but optional interface kit not yet | available. Can recharge Radio Shack's optional, monolithic | NiCd pack, but not AA cells within the scanner. IFs are | 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," | by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for | a review which includes quantitative test results. |

PRO-67: 1997 vintage. Good portable 200 channel scanner | using up conversion. Replaces PRO-51 and has better image | rejection and super fast scanning. Service Search lacks | police frequencies. Fixed AM/NFM modes and step sizes. Can | lock out up to 20 frequencies during a search. Can recharge | AA cells within the scanner. Frequencies adjacent to the | cellular phone bands censored so our PRO-67 will not receive | 868.9625 or 823.9625 MHz. Intermediate Frequencies are | 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," | by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for | a review which includes quantitative test results. |

PRO-2001: Early, single bank 16 channel programmable. | Reasonable coverage of the 3 traditional bands, minus | aircraft band. LED digital display as well as an LED per | channel. Mechanical lockout switch for each channel. Delay | is either on or off for all channels at a time. High | synthesizer noise level. Troublesome plated through holes | on digital board in some units renders radio virtually | unfixable. Could never get mine to work more than a few | days in a row; always another bad connection. Some owners | have no trouble. |

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 | FM commercial broadcast band channels. Includes aircraft. | Good frequency coverage and functionality, but at a high | price. Poor human engineering: difficult to read keyboard | makes the PRO-2003 hard to operate unless in a well lit | room. Keyboard label coloring improved on newer units. | Rather slow scan rate and high price. Although there are | provisions for 12VDC operation, the cabinet shape and lack | of mounting bracket makes mobile operation impractical. | Scan rate only 8 channels/sec vs. 15/sec in Regency and | Bearcat. Causes RFI: Plastic case permits scanner to | radiate signals into nearby receivers. |

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound

Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987. |

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, | LCD display and raised rubber keys. Lots of memory but | scans too slowly and lacks 800 MHz. Ten "monitor" channels. | Radio Shack seemed to have an overstock of 2021s as they | were on sale for such a long time. Close out price dipped | to about $200, which made it a nice scanner for beginners. |

PRO-2022: Base/mobile scanner. Like the PRO-2021 but | includes the 800 MHz band. Somewhat prone to intermod in | the 460 MHz range. Cellular images throughout the 847.6 - | 869 MHz range. See September 1996 Monitoring Times for | modifications. |

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. | 200 channels, global delay. Scans and searches fast. | Count, AUX, and Auto Store features. Accepts optional CTCSS | board. Dual conversion with 10.8 MHz and 450 kHz IFs -- | lots of images and birdies. Prone to severe intermod, |

especially when used with an outdoor antenna. See "The | Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, | in June 1995 Monitoring Times. |

PRO-2037: 1994 vintage. Triple conversion all plastic base | scanner made by GRE. Home version of the PRO-62 portable | but with more intermod. 200 channels in 10 banks, one | search bank, selectable AM and FM. Uses up conversion | circuitry but inadequate front end filtering still allows | images, though not as bad as in 10.7 or 10.8 MHz IF | circuits. Crisp, respectable audio given the top mounted | speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in | July 1995 Monitoring Times. |

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT

but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system | tracking base made by Uniden. Tight front end. Excellent | performance. Chassis-less, plastic construction. Squelch | and volume knobs too close and Manual key is hard to find. | IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM | modes are factory set and not selectable. 300 channels in | 10 banks and a 2 second rescan delay may be programmed on a | per channel basis. Query feature identifies duplicate | memory channels. Our PRO-2050 scans at 78 channels/sec., | skipping over empty channels. 10 priority channels. Up to | 50 frequencies may be locked out from limit search. A | single pair of limits may be programmed for a limit search. | No Direct key or direct search facility. Factory | preprogrammed frequencies for police, fire/emergency, | commercial air, public service, and weather, but not marine. | See May 1998 Monitoring Times for a review which includes quantitative test results. *

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER) |

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR |

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC |

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

> What model do you suggest..and a good vendor??

Uniden sells two TrunkTrackers(BC235XLT handheld and BC895XLT base)
while Radio Shack sells three(PRO-90/91 handhelds and PRO-2050 base).

I highly recommend the BC895XLT as a base station. For a handheld
the PRO-91 uses AA batteries for power but only has 150 channels
in five banks. The PRO-90 and BC235XLT use proprietary ni-cads;
the PRO-90 comes with one while the BX235XLT comes with two.

I have reviews of all five models at my web site. If interested,
stop by my home page below and follow the link for radio monitoring.
Page down and follow the link for the radio reviews.

Stop by Radio Shack to see the sales they are having on the PRO-90
and PRO-2050. A large number of dealers carry Uniden products so
call around for best pricing and current specials. Start here
http://www.qsl.net/n2mca/DEALERS.HTM

Good luck!

Source record: 160358

I just got the mod sheet for the RS PRO-39, and it says that by removing diode D6, it opens up the cellular freq range, which can be searched in the appropriate 30 kHz steps. My question is: Since the standart step for the 806-960 MHz band is 12.5 kHz, does this mean that if I do this mod I will no longer be able to recieve normal business band communications in the 12.5 kHz steps? Is there a way to alternate between the two? Or would it automaticly go into 30 kHz step mode when I enter the cellular region? If you have any answeres to these questions, please e-mail me!! I would really like to know!!! Thanks in advance!!

> for each frequency.
> Wondering how the Condor compares? Is it worth the money?

The Condor is a good antenna for the money but it can't hold up
against a 2 foot or longer telescoping whip. No rubber duck
type antenna can. For people who have been used to using the
stock duck on their radio, going to the Condor is an upgrade.
But from your point of view using a telescoping whip, you'll
probably find the Condor less useful but more portable.

> Is it tuned for the low band (30 to 50 Mhz) also?

Not that I know of. My experience indicates it is only slightly
better than the "average" duck antenna. For such low freqs, you
need a nice long antenna. That's why you'll probably find you
prefer your current whip.

For more info, try my Handheld Antenna review :

While the FCC has laid out the mode to be used on each band, there are
some users who deviate from it and do as they wish to try and hide
and remain anonymous(FBI, CIA, DEA, etc.)

> Is there a FAQ that will tell me everything I need to know about

It will automatically change to the proper stepping, related to the band you are monitoring.

Also, as I recall, you have to do a CPU reset after removing the diode. This will loose ALL programming you have previously entered.

Most of the Cheap units dont work to well on VHFInfact most of them only
work "well" on the upper portion of HF (say 20 mhz to 30 mhz)
There are a few Cheap VHF/UHF units out there, the one Radio Shack carried
had
no adjustment for setting callibration on swr All it had was a power sw (5w
15w)
and a SWR/Power Sw. If I remember they were about $30 new

Heya-

I was curious, a few years ago (12 or so) I bought a device that "doubled" the freq. of a scanner (I.E., you type in a search range of 422.000 to 433.00 and the scanner was actually searching 844.000 to 866.000. As I recall, it was not perfect, but it did work. Do they still mfg./sell these?

Also- is the cell. ban in all scanners, or is it true you can grab a new cell-ready scanner in canada?

Just curious.

Regards-

Bill

>I am going to travel there and take my scanner.

Once you get there, you may want to keep the scanner somewhat "low profile" because they really don't like things like scanners. I know for a fact that even a simple shortwave reciever that covers .150-30 MHz was illegal to own (as of about 6 years ago) in Russia (and Ukrain, for that matter) because it would pick up HF utility stations. What part of Russia are you traveling to?

>Pro-2004 not use these steps in the entire cellular band?
>

The earlier production Pro-2004s have the 30kHz steps in the older cellular frequency allocations of 825-845MHz (phones) and 870-890MHz (towers). Outside of these ranges the default steps are at 12.5kHz. The later production runs took into account the freq allocations of 823.970-849.000MHz and 868.970-894.000 MHz. Now when the earlier production 2004s defaulted at 870.000MHz for the first step in the cell freq band, you would find that there were cell channels at 869.990 and 870.020Mhz. Even though it used the correct 30kHz steps, they tended to be off 10kHz or so from the actuall channel frequency. It isn't devastating, but can be annoying to some degree....especially when you know that a 2004 made a few days/weeks/months later had the situation corrected.

Bill-
There are frequency doublers or halvers(which you are refering to) and frequency converters. The frequency converters are a bit better in most cases. They take the original frequency and feed it into a 400Mhz oscillator. The freq converters are usually set up to knock 400Mhz off of the original frequency. For instance, if you wanted to listen to 864.250 Mhz, then you would actually tune 464.250 MHz on the scanner. It can work either way depending on how you want to set up the circuit. Most of the freq. converters were marketed so you could listen to 800MHz ranges when you have an older scanner that only went up to 512MHz or so.
One of the bests freq. converters was made by GRE (the manufactuer of Radio Shack Pro-2004/5/6, Pro-43, Pro-2035/2042 etc. scanners). These units are no longer able to be sold in the US. Some places may still have them in stock and can still sell the "existing stock" items, but they would be very hard to find.
Ramsey and other companies make kits that can be bought.
Ramsey's kit takes the 10th harmonic off of a 40MHz oscillator. It isn't the most stable device, but it works to some degree. If you know enough about what you are trying to do, you can grab a Mini-Circuits catalog and put together your own and get better results or you can play around with an old TV tuner to knock several MHz off of the input frequency.
Yes, you can get unblocked scanners in Canada. At Radio Shack

though, you will find that these are blocked. RS probably wanted to save a few bucks or some legal hassles and decided what is good for the US is good for all of North America (including Canada). If you go to RS in Canada to buy a scanner, it will be blocked. You can pick up other unblocked scanners at other places. Durham and Atlantic Ham are two places off the top of my noggin'.

Getting married soon and getting rid of the scanner. Well, you better keep it because once the honeymoon is over, you will need something to keep you occupied while you are sitting at home and she won't let you out of the house. It is also nice to have around knowing that something in your life is able to squelch interference and handle the front-end overload.

I'd check your DC voltages - The serial port on an old Toshiba laptop I
picked up for this purpose only yeilds +8 volts and -7 volts which appears not
to give incredible gain. The best way I found to test it for functioning is to
run HamComm and go to the scope function. You can run anything you like into
the interface, such as squelch noise from a scanner- speaker output so you can
run the level up and down. This will indicate if the interface is doing
anything at all the serial port can see.
BTW, for those building this slicer into a DB25: I found some really
REALLY tiny 10uF @16v electrolytics in the Radio Shack electrolytic grab bag
package (4 in mine), for $2.29. Much smaller tha anything they sell
individually & smaller than any leaded tatalums I could find. I know these
packs vary a lot, but might be worth a look while you're there sometime. They
really help cramming the circuit into a standard size DB25 hood.

FOR SALE ALL PRICES OBO - MAKE ANY OFFER

The following books are from the inventory of a closed mail-order bookdealer. None are used; all in perfect condition unless otherwise specified. Satisfaction guaranteed or full refund.

List revised 4PM Saturday, May 16, 1998

Several books ordered from previous ads were not paid for and are again available. If you inquired about a book previously or ordered it and received a refund, you may order at the lower of the two prices.

The Radio Amateurs DX GUIDE, 14th ed., 1981, by Radio Amateur Callbook, Inc., 46 pages. $2.
The Incredible Secret Money Machine, Don Lancaster, Sams 21562, 1st ed., 3rd ptg, 1980, 154 pgs, list $5.95. $3.
Computer Design Development - Principal Papers, edited Swartzlander, Hayden 5988-4, 2nd ptg, 1978, HARD COVER. Only $13.
The Radio Amateur Antenna Handbook, Orr & Cowan, 1st ed., 3rd ptg, 1980, RPI, list $6.95, $5.
S. Gernsback's Radio Encyclopedia 1927, McMahon, HARD COVER, #1659 of 2000. Reprint 1974, 84% scale, Vintage Radio. 175 pages. $14.
How & Where To Prospect for Gold, Ballantyne, TAB 1159, 1981, 240 pgs, list $9.95. $4.
The ARRL Extra Class License Manual, 1986-1987, 258 pgs, list $5. $2.
Radio Astronomy for the Amateur, Dave Heiserman, TAB 714, HARD COVER, 1st ed., 2nd ptg, Jan. 77, list $8.95. $4.
Listen to Radio Energy, Light and Sound, Calvin R. Graf, Sams 21525, 1978, 160 pgs, list $6.95. Damaged cover, $3.
Communications Monitoring, Robert B. Grove, Hayden 0894-5, 1979, 116 pgs, list $5.95. $4.
Electronic Circuitbook 1, Project Constructions, Forrest Mims III, Sams 21241, 1976, 95 pgs, list $4.95. $3.
Telephone Accessories You Can Build, Gilder, Hayden 5748-2, 9th ptg, 1981, list $7.25. $6.
More Telephone Accessories You Can Build, Gilder, Hayden 0893-7, 2nd ptg, 1981, 128 pgs, list $5.95. $4.
Analog Instrumentation Fundamentals, Leonard, Sams 21835, 1st ptg, 1981, list $19.95. $8.

Optoelectronics Guidebook---with tested projects, Fox, 190 pages,
HARD COVER, 1st ptg, Jan. 1977, TAB 836, list $8.95. $4.
World Radio TV Handbook, Billboard Publications, 1983 edition,
540 pgs, $3 or 2/$5. Some other years are available when
they surface; ask for specifics on 1979, 1981-1990. Other
editions $8 each; addtl copies $5.
The IRCA Almanac, 2nd ed., 1980, list $9.95, $1.
North American Radio & TV Station Guide, Vane A. Jones, 14th ed.,
Sams 21725, 1st ptg, 1981, list $7.95. $5.
Same title as above, 15th ed., 225 pgs, 1984, list $9.95. $6.
FM Atlas and Station Directory. 4th ed., Dr. Bruce Elving, $5.
5th ed., $3. 7th ed, list $6.95, $1. 8th ed., 1983, 128 pgs,
list $6.95, $2.
IRCA Almanac, 2nd ed., 1980, 168 pgs, $1. Same title, 3rd ed., 1983,
164 pgs, $2.
IRCA Foreign Log, Volume 6, 7, or 9, est. 160 pages, 1978 to 1981,
$2 each; specify volume number.
Radio Communications Receivers, Cornell Drentea, TAB 1393, 1982,
280 pgs, list $13.95. $6.
Communications World, 1981 Edition, Davis Publications, 118 pgs,
list $1.95. 50 cents. Contains White's Radio Log.
Rider's Radio, misc. volumes #6 to #15. Condition varies
from fair to like new with most being in excellent
condition. $25 each, postpaid. Inquire as to
availability of particular volumes.
Photofacts, Howard W. Sams, #1-150, 600-1400, with some exceptions,
USED, good condition, any number (e.g., #23, #1004, #1350),
$8. Any folder (a particular radio, TV, etc.), $4.
Any 100 consecutive numbers, $500. All Photofacts plus
actual shipping costs.
Basic Automobile Maintenance, Dennis Caprio, Sams 21649, 1980, 182 pgs,
list $9.95. $4.
Understanding Your Car, Samuel Walkov, Sams 21623, 1979, 240 pgs, list
$9.95. $5.
****The following photographic books were published 1970-1981****
A Short History of the Camera, John Wade, Fountain Press, 1979, 140 pgs,
list $4.95. $3.

In Austria, a police officer is trusted to estimate the speed
of a vehicle with the naked eye.
No need for radar speed traps. You have to proove, that you
didn't speed.

Regards,
Friedhelm

Hi Ray,
I have a copy of Bob Parnass' review back in 1987
on my web site. Go to my home page below and follow
the link for radio monitoring. Down at the bottom
are a set of buttons. One takes you to my review
page. You should be able to dig out the rest.
Happy reading!

To all concerned;

I just want to say that I am very dissapointed in the way
Mr. Cheek commented the report put out by Rich Wells on the
latest Winradio product.

I have had the pleasure of reading (now several) reports
and tests by Mr. Wells, and I can only say that they are
very useful ,detailed and objectively to the point...

I appreciate the _pressure_ that Mr.Cheek must has been
under in the past (from reading this newsgroup). But I do
have to say I feel that by posting such messages ,he can
only make matters worse..

Just want to say that I support Mr. Wells, and that I have
taken great pleasure in reading his reports and tests.

Thank You...

Best Regards,
Knut Otterbeck

Hi all,

I would also like to see this take place. Enough of personal slug matches .. i'm sure there are better news groups to do that. No names though ..

I think this group is capable of excellent things .... just look at the state of 'Trunker','Etrunk' and other great applications. The ability to keep updated on new technology which never be realized by most if it wasn't for this group. Sure we could search around but it isn't as productive. I think it is in everyones best interest to keep this group on topic.

The comments expressed have been on my mind for some time ... I just maybe didn't want to be the first to voice them.

Without prejudice,

Kevin Fisher

Voice inversion sounds a lot like people are talking through a real bad donald duck filter. You WON'T be able to understand it. (at least without an MX-128 voice inversion chip available from MX-COM) (check out their web site) You'll have to build it though. Yes, some 46 Mhz phones use it.

The BC2500XLT might have 30khz steps sizes. A
web site on restoring the cell bands claims it does.

What's the difference in the cellular programming if
both scanners use the correct 30khz steps? Does the
Pro-2004 not use these steps in the entire cellular band?

The older PRO-51s will search in the correct 30 kHz steps when the cellular band is accessed via the notorious keypad trick. I have a PRO-51 with a production date code 12A3 that operates in such manner. I have been told other Uniden scanners (PRO-46, PRO-23) also have this capability but can only speak with certainty about the PRO-51. This has limitations and if you search beyond the limits of the cellular band, the stepping changes and you have to start over.

The keypad trick *allegedly* will work on PRO-51s with a date code of 7A4 or earlier.

Hi gang,

Just picked up an InfoTech M-600 at Dayton today and am in need of a manual. Photocopies would be fine.

Thanks

Bryant

4686. F.S. Pro-51 Scanner / Great Condition

Newsgroup: rec.radio.scanner
Date: 1998-05-16 00:00:00 UTC
From: radioman@localnet.com
Message-ID: <6jivuorlb1@news6.ispnews.com>
Source record: 160479
Cross-posted to: rec.radio.swap,alt.radio.scanner,rec.radio.scanner

Realistic Pro-51 scanner in great physical and operational condition. Date code is 1A6. It does a great job getting cellular images (I believe that encompases a big chunk of the cell band) if that is what you are looking for. I do not believe it to be modifiable as the date code would indicate it being too late for that. It has 200 memory channels. It has very good sensitivity and great audio. It covers the following frequency areas:
29-54mhz; 108-136.975mhz; 137-174mhz; 406-512mhz; 806-823.9375; 851-868.9375; 896.1125-956mhz

I have the original box, manual, packing materials, rubber-duck antenna and newer ni-cads. Th charger/adapter DOES NOT go with the unit. It stays with my other Pro-51, my Pro-46 and my Pro-43.

I will throw in a dated but still quite accurate mid-atlantic region frequency guide at no cost. I don't travel very much anymore.

Asking best reasonable offer starting around $90.00. I will pay the freight on this one if the offer is reasonable.

I will accept offers until Tuesday May 19, 1998 at 12:00Noon E.S.T.

If interested, please e-mail your offer to me at:
radioman@localnet.com

I am thinking of purchasing the Condor for my handheld scanner. Currently use a long adjustable telescopic whip that can be adjusted for each frequency. Wondering how the Condor compares? Is it worth the money?

Is it tuned for the low band (30 to 50 Mhz) also?

: > If your 2004's CPU is a GRE-0327A, then it is up to
: > modern standards. If it's a GRE-0327, then the
: > cellular programming is kind of dated.

: What's the difference in the cellular programming if
: both scanners use the correct 30khz steps? Does the
: Pro-2004 not use these steps in the entire cellular band?

Yep-the older 2004's switched to a 12.5 step above 890 Mhz(the end of the old 666 channel CMT base band)-the newer CPU switches to 12.5 steps at 896 Mhz-the 832 band goes to 894, and some airphone stuff goes from 894-896(also in 30 Khz steps).
So if a person was going to monitor CMT's, the later CPU is desireable. Of course, if your listening interests lie elseware, then it does not matter.

With the Sound Card , and a Freeware program avail on my site , you can decode in Real Time (as fast as your computer is) CTCSS tones...or DTMF' Tones...

Sure beats buying some hardware :)

New version of the ctcss finder...now with Logging & Best of all...Emil has released it again as Freeware....Nice guy! :)

I use this program alot , to Hunt down tones , in my area...

Grab it from : http://members.xoom.com/ontscan/

New Verion is ctcss.zip

Other Version is (Just as good , no logging tho) DTMF.ZIP

Enjoy!

I was looking through a Bearcat mini-catalog and the different bands you get in each of their scanners. I figured I could just decide what bands I wanted and look at scanners that get those bands.

But now I'm seeing things like "selectable mode (AM, WFM, NFM) - hear transmissions regardless of how they are transmitted". What is this all about? Is there a FAQ that will tell me everything I need to know about what's available/ what to consider, etc.?

Source record: 160498

I have come across a regency turbo scan 800 scanner. When I turn it on it just stays on one frequency(the priority frequency). If I press manual it wil scroll through other frequencies but when I take my finger off manual it goes back to the priority frequency. No other keys seem to work. It beeps when you turn it on, but when you open the squelch nothing else is heard. Does this scanner possibly have a reset function like [MAN] [2] [9] on some bearcats or the reset button on some radio shack scanners? ANy help via e-mail appreciated.

Yes, and we all know that this thread, like any other thread Bill Cheek
is involved in, will go on for weeks and weeks, perhaps even months.
It is a waste of time to try to go into a debate with him. He will
under no circumstances yield an inch. The mere possibility that he could
in the slightest way be wrong, does not exist in his universe.
He will continue to attack again and again, until it evolves into
a name calling contest.
He once compiled a few good books about scanner modifications, but since
then he has started to believe that he, and only he, could possibly
possess any technical knowledge about radios and scanners.
The thought that anything, anybody writes here about scanners could
be right and even valuable to the scanner community, is absolutely
inconceivable to him.

<snowball5@hotmail.com> writes

Hi,

>I know that there is very little information available now on the
>AR8200, but I hoped to get some thoughts from you all.

Details of the AR8200 had been kept under an almost "Skunk Works" level
of secrecy until this week when the '8200 was due to be revealed at
Dayton. Additional details have now been released and this along with
some higher resolution graphics are now available.

>From what I have seen and read of the 8200 it is going to leave the 8000
>behind as far as features(?) and technology (the dynamic memory banks
>sound super) and could lead to the 8000 being discontinued.

The new AR8200 is not due to be replace the AR8000 and the latter will
remain available for the forseeable future. There will obviously be a
time when the AR8000 is no longer available but it does not appear that
it is AOR's intention to "kill off" the '8000 with the new model - it
still has quite a few miles in the tank yet.

>My main questions I would like your thoughts on are:
>
>Do you have a thought to what the 8200 might cost? When the 8000 was new
>I believe it was about $800. Will the price be so high on the 8200
>considering that the newest high end scanners to market have been in the
>$300-$500 range?

I can't speak for US Distribution but the UK price looks set to be a
little over 400.00 Pounds including VAT (our sales tax) or 355.00'ish
without tax (as a guide that under $600 with rates as they are).

>I have read conflicting reports to whether the 8200 has received CE &
>FCC approval. I know nothing about the CE but FCC approval most likely

The AR8200 has passed CE approval.

>means a scanner with certain frequencies blocked. Will there be a US and
>a non-US version of the 8200 that does not suffer blocking? How are the
>8000's handled now, is the 8000 the naughty (unblocked) scanner and the
>8000B the US version? Are there other difference's to justify the higher
>price on a blocked scanner?

The AR8200 has continuous coverage.

I am led to beleive though that there will be "two" models and the version (AR8200B perhaps ?) to be distribued (non Government etc) in the States will use a different processor in the way the AR8000B now does.

The AR8000B was produced especially for the domestic USA market and AR8000's distributed elsewehere continue to be "full coverage" and use the same CPU as they did before.

Hope that helps a little.
Have fun.

Cheers,

I can't seem to get my Sound card to play the audio out of my
PCR-1000. Do I need a program or is there someplace in W95 that I need
to twiddle with?
I tried SCANREC to at least autolog and it didn't work :(
Mind you the sound recorder with W95 works fine for quick records so
Something is working :)
Anyone have similar problem or know the answer?

Eric

Technically.....
It is NOT illegal to own a hand gun in Chicago, however it IS illegal
to possess an unregistered gun. Since Chicago will NOT register a
handgun unless it is required for a bonafide job (ei. police officer,
bank guard, security guard, etc.) , being your caught with a handgun
you will be charged with "Possession of an Unregistered Firearm".

This law makes it impossible for the common Chicago citizen to own a
handgun legally since he can't register it. The city does register
rilfles and shot guns. The city did this to basically outlaw handguns
while avoiding the Bill of Rights thing since they don't technically
take away your right to bear arms.

i have a pcr-1000...hooked into a sound card.

Did you use a stereo to mono plug adapter....the sound card is stereo.

Did you install it in the line input jack.

Did you check the mixer setting to make shure there turned on and in proper balcance.

Are you using a awe64 or what type of sound card.

Did you make sure the volume is up on the pcr-1000 and it not a squelch problem.

See ya

It looks like a clone design, but I bought one and if my daughter hadn't destroyed the box I'd have taken it back. It is not very robust physically, being made of flimsy TV antenna parts. The problem is the "wing" elements are all attached to a standard guage long element several inches from the plastic suppoert. These are the same light, riveted elements and insulators that break off the RS TV antennas every time the wind blows over 10 mph.
It does well enough picking up signals, but I was forced to put it well down on a pole on the east side of the house to protect it from wind, so it is hard to tell. It has bent already in 2 weeks. I may have to move it inside the attic before it comes apart, or let the wind strip the long low band elements off and use it for 800.
The 20-014 ground plane antenna isn't overly robust, but is still much tougher. Even a good sturdy small TV antenna turned on it's side would be as good or better than this.
I'm an RS booster, but anything based on their TV antennas is not up to the winds in the midwest!
Neutrodyne

4730. NEW! Alinco DJ-X10 mod

Newsgroup: rec.radio.scanner
Date: 1998-05-17 00:00:00 UTC
From: Sima <sima@technologist.com>
Message-ID: <355E5BB1.FAA4C683@technologist.com>
Source record: 160273
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hello.

NEW! Alinco DJ-X10E modification for direct discriminator output.

Locate IC 31136 on the lower side of second RF board. Pin 9 of this IC
is
baseband audio (discriminator) output. If you don't need clonning
function,
you can trace one of the 2'5 stereo plug pin, cut it from other circuit
and
connect to 9 pin of 31136.

Now you have audio and discriminator output in one receiver with
0.1-2000MHz coverage. Have a nice scaning! :)

Sima.

p.s. more information about this receiver and your comments send to
sima@technologist.com, please.

You mean the audio is scrambled right? Well, the answer is that you
hear it right away. The audio is so distorted that you can't understand
it. Trick: you can hear the conversation is you go to SSB and tune
slightly off frequency. There will be a very loud high pitch squeal but
you will understand what is being said.

Jack:

The Icom PCR-1000 software is like that old Clint Eastwood move... "Good, Bad, and the Ugly" It gives you a choice of three different graphic radio interfaces. One is like a rack mounted, component system, another like a high-end desk-top communications receiver, and the third is similar to a mobile rig. For the most part, it's pretty functional, and intuitive. You can't do any customization on it, and there are a few things that don't work, or work as you would expect them to. Overall, I'd have to say, it's one of the best programs I've seen if only for the fact that it's a departure from the old DOS stuff we've had to live with for so long! WinRadio software will not work with the Icom PCR-1000. There are some third party programs that either work with, or will soon work with, the PCR-1000... ScanCat comes to mind. Icom will probably be releasing an upgrade in the near future.

It's an excellent communications receiver, and works very well. It is well constructed, both mechanically, and electrically. It is portable, even works with laptops! It doesn't take up an expansion slot, or an IRQ interrupt. It doesn't burden your PC's power supply, or generate unwanted heat within your PC!

4745. Problem with BC230XLT

Newsgroup: rec.radio.scanner
Date: 1998-05-17 00:00:00 UTC
From: Steve Houchen <sbh@ibm.net>
Message-ID: <355FA2F5.9C3EA10@ibm.net>
Source record: 160288

Hi everyone. I purchased a BC230XLT about a year ago, to be used mainly at NASCAR races. The problem I'm having is that when I tune to 467.0625, the scanner receives "silence" that I can't squelch out. (Like what you would hear if an FM radio station was broadcasting a "moment of silence".) And if I knock on the side of the scanner while wearing a noise-reducing headset, I can hear the knocking noise in the headset. It is very difficult for the scanner to pick up some signals broadcast on this frequency. Right now, I also have a borrowed BC200XLT that does not have the same problem. (Before borrowing the 200, I didn't realize it was a problem with my 230!)

To be specific... 467.0625 happens to be Jeff Gordon's frequency. And I happen to be one of his fans. (Please don't hold that against me!) At The Winston last night, I could hear Jeff perfectly clearly, one of his spotters so-so, but couldn't hear his crew chief at all (using my 230). (Reception of all three was perfect with the 200.) There was no antenna attached to either scanner at the time. I know they make those little stub antennas for use at the track, but I don't think that will solve this problem. (Or will it?)

The "problem" occurs all the time -- even now that I'm back at home. There's no signal on the 200, but the 230 constantly picks up a "silent" signal. I apologize for probably not using the correct jargon but scanning isn't really a major hobby of mine, especially since the police in Charlotte use a trunked system.

If it is possible to "fix" this problem... I'd like to do it before the Coca-Cola 600 this weekend! I know that finding a different driver to listen to would solve the problem, but that's not the solution I'm looking for...

Thanks for the advice,
Steve Houchen, sbh@ibm.net

I was wondering if anyone knew of any mods for this radio. I am not interested in cellular, i was thinking more along the lines of computer controlling, more memory's, being able to see the freqs when scanning instead of that stupid scrolling thing it does, mabey adding a s meter, and the really far fetched one, unblocking the 54 to 108 range and being able to receive wfm. Well i guess thats it, i don't expect an answer, but feel free to flame if you like, i don't mind. Oh yeah one more thing before i pull up my pants and get off the puter. I hear everyone ranting and raving about icoms and kenwood receivers, now they are great recievers (sensitive, selective) but suck as scanners. Just my two cents. Everyone have a good day or night whatever it is wherever your at.

What you are hearing is called a "Birdie." It is caused by your scanner's circuitry. All scanners have birdies. They are often listed in your scanner's owner's manual. Not all scanners have "birdies" on the same frequencies. In fact "birdies" vary among different scanners of the same make. Your scanner probably has about a dozen or more "birdies." You can tell that the sound you are hearing is a "birdie" by removing he antenna. The same noise you describe should continue. You should still be able to hear your favorite racecar driver on this frequency without any problem other than not being able to squelch this frequency.

>
>Lt. Bill Ladendorf, Chicago Police
>Scanning Junkie

==========

Lt Ladendorf,

If the City of Chicago requires one to "register" a handgun in order to be in legal possesion, but then decides that no-one (common citizen) can "register" a handgun, isn't that a direct infringement of the 2nd Amendment?

Has this ever been challanged in court and what was the outcome?

This seems very similar to what happened in Los Angeles a few years ago. LA would not issue a CCW permit to anyone. Period. After serveral years and an large lawsuit, today it's possible for the (common citizen) to aquire a CCW permit.

Your choice proffession is appreciated,
PJ Hunt

How's about that it fits ALL computers that
can support a 3/4 form factor AT card?

> There was no other information which helped me
> evaluate the review or the product under review.

I wasn't trying to help you evaluate anything.
I didn't know you were interested.

> No technical data were offered to back his
> opposition to Mr. Wells' conclusions.

I would suggest that "3/4 form factor AT card"
is pretty brass tacks technical.

> In other words, Mr. Cheek's comments did nothing to enhance my
> knowledge about or enjoyment of this hobby.

My reply to Mister Wells' post wasn't designed
to enhance your knowledge or enjoyment of this
hobby. I don't believe I even knew you existed
until today. And even now that I know, I still
don't know how to address your needs.

It takes a while to figure out what folks want
and don't want.

Now if Mister Wells suits your fancy, then heck,
man...go for 'im. Like I told somebody else, he
traipses around on water without splashing and
jumps into his skivvies both legs at a time.

Me, I got no use for messiahs and such. The last
one of any significant benefit to humanity died
around 2000 years ago. And since then, there have
been more pretenders than you can shake a stick at.
So I don't put stock in any of 'em.

> I expect more than unsubstantied

The substantiation is spelled out in plain English
in my post. Is English not your native language?
I don't know many other languages.......

> and offensive ad hominem attacks from a supposed
> authority.

Supposed? Who is supposing? I have a hard enough
time taking care of myself without taking you on,
too. Nooooooosirrrrrrrreeeeeee, you just go have
Mister Wells take care of you. After all, he IS
the authority. Believe me. My "authority hat"
was blown away by the wind of his passing and got
lost. So don't pay me any mind at all......

Offensive? Oh you poor fellow, you. You must be
half-eaten up with things that offend you.

Ad hominem? Hey, I always heard that hominy grits
were good for the lower intestine. You ought go
have yourself some grits and biscuits with frogeye
gravy and let yourself settle down a little.

I mean, Mister Wells might be able to sachet around
on water a little and get into his skivvies bot legs
at a time......but I don't much think he can turn
water into wine.....not nearly as well as he can
turn wine into water a couple of hours after he
slugs down a jug.

You should be more suspicious of messiahs and
water-walkers and skivvy jumpers.

> Mr. Cheek has no credibility with this neophyte.
> I'll ignore any future posts from him.

That would be nice. Cuts down on my workload
a little. Would you be so kind as to warn me
in advance if I start building any warm fuzzies
inside you?

I'd sure hate to give you the wrong impression.
Know what I mean?

I have been attempting to access the FCC database all evening using the address exactly as it is has been presented in this thread and keep getting errors. When I remove the ":8080" from the url I can get into the home page, but beyond that no luck bringing up the frequency databases.

I see this is a beta site with plans to make some parts available only through a 900-number at some point. Could it be that the beta period is expiring, or is it a weekend-related FCC server problem that may clear up with the resumption of business on Monday?

Anyone familiar with this site and its particulars?

Glenn.

Hey, Ian! Cool off man!

> If you don't like what Rich wrote in the review don't read it!

If you don't like what I write, don't read it!

> Noone is pointing a gun at you saying that "YOU HAVE TO READ IT".

No one is pointing a gun at you saying that "YOU HAVE TO READ IT".

> Everyone is entitle to air their opinion, so do you!

Wellllll.....I gave my opinion. Mr. Wells' bias
was visible in the ways I mentioned, and if anyone
cares to read his scripture in total, that bias
is visible in many other ways, too.

> But stop crying like a elementary
> school kid just because you don't like something.

Awww, I don't cry. I just tell it like I see it
and some folks don't like it. Like you, ferinstance.

> If you want to show us that Rich's or anyone else's
> review is flawed, show us your findings.

I did. Some of 'em, anyway. Didn't you READ it?

> And the readers of this newgroup will judge who is right
> and who is wrong.

That's their prerogative. Regardless of WHAT
is truly right or wrong.

And they'll exercise that prerogative no matter who
does or says what.

But here is the salient point......go back and READ
what I said. And then read what Mithter Wells said.
And then wonder.....scratch your head and wonder WHY
in that monstrous "review" did he have to spend time

on hearsay that really isn't pertinent or relevant,
or for that matter, truthful.

If you can find one thing to wonder about, then
you'll find a dozen others, too. If you don't find
any, then....heck.....go over and sign up. He's
gathering up a flock and headed for salvation somewhere.

I mean, heck, you gotta follow the "call", right?

Good grief, it's utterly sick. But you get
used to it after a spell. It's all in a day's
work.

> As a happy owner of both WR1000i and PCR1000, I was concerned about
> what I considered to be a serious bias in Rich's review and mentioned
> a few specific examples to him, such as his failure to acknowledge the
> much faster scanning speed of WR1000i

Whew! I am delighted that someone noticed!
I didn't want to pick his review apart at
the seams, so I hit on the most obvious scam,
the emphasis on "hearsay" and elsewhere on
the bit about "people not buying WiNRADiO"
for various and sundry conjectures........

How the hell does he know what and why people
will buy? If he's in the business, he MIGHT
know.....but the if that's true, then he's
hiding his affiliations. If he's just a raw
hobbyist, as he pretends, then he can't know
what people will buy and why or why not. But
he tries to come off as the "objective expert"
there. Which......smacks of an agenda.

The two items I pointed out brought out the legions
from heaven's gate. Had I said any more, I'd
probably have the archangels camped out on my
front lawn.

So I was hoping someone else would read Wells'
"review" and see the various holes in it. I
appreciate your doing so and mentioning it.
Your objectivity is the best model yet, anyway.

> I don't believe now that Rich's review was written to
> purposely harm anybody:

I don't have any "beliefs" along that line, either.
But there is a very pregnant question relative to
his "mission" or purpose for the pretense of pure
objectivity. Is it just stupidity? Ignorance?
Lack of intestinal fortitude? Or is there a purpose?

The thing that seems to stand out is Mr. Wells'
has positioned himself beyond reproach. By the
gods, his "review" was objective and that's all
there is to it. Critique not invited or accepted,
as you saw in these threads.......

<Balderdash!>

> I believe that Rich is actually
> very nice and tries very hard to be objective -

But you, yourself, elucidated areas where his
objectivity took a pause......

But the bottom line is that I don't know what
his purpose was.....and he isn't responsive to
the criticism, so the pregnant question bloats
into the second trimester.

Anyway, thanks for your objectivity.

Before Tandy stopped supporting the 2004 back
in 1995, you could buy the newer GRE-0327A CPU
and stick it in for a complete upgrade. I snagged
a few spares before they shut down the supply.

Whew!

> Pro-2004 not use these steps in the entire cellular band?

Well, early PRO-2004's didn't. The firmware in
the CPU was set to see cellular as 870-890 MHz
and 825-845 MHz. But that same year, the FCC
tacked on the growth bands for the 868.970-894.000
and 823.970-849.000 current allocations.

Newer 2004's came out with the revised firmware
in the GRE-0327A chip. So the older 2004's step
in 30 kHz only in 870-890 and 825-845 MHz, whereas
later models do it all. Mostly, it's no big deal,
but definitely worth a mention since it's the only
production variable in the 2004 of which I am aware.

Charge in Ruby Ridge Case Dismissed

.c The Associated Press

BOISE, Idaho (AP) - A federal judge Thursday dismissed involuntary manslaugher charges against the FBI sharpshooter who killed the wife of white separatist Randy Weaver during the 1992 siege at Ruby Ridge, Idaho.

U.S. District Judge Edward Lodge accepted the Justice Department argument that Lon Horiuchi was acting in the line of duty when he fired and was protected by the Supremacy Clause of the U.S. Constitution, which keeps federal agents from state prosecution for actions within the scope of their job.

Boundary County Prosecutor Denise Woodbury charged Horiuchi last August with firing the shot that went through the cabin door and killed Vicki Weaver as she held her baby daughter.

It was the third death in the 11-day standoff that began when federal marshals tried to arrest Weaver on a gun charge at his isolated mountain cabin. They encountered Weaver's son, Samuel, and his dog, and an exchange of gunfire left the 14-year-old boy and Deputy Marshal William Degan dead.

Woodbury maintained Horiuchi acted negligently. Horiuchi contended throughout that he was following the procedures set out for dealing with the Ruby Ridge confrontation. The unusual ``rules of engagement'' told federal lawmen to fire at anyone moving around the Weaver cabin.

Woodbury also charged Weaver's friend, Kevin Harris, with murder, but that charge were dismissed. Harris and Weaver were acquitted in an earlier federal trial on charges of killing Degan.

> That being said, (and in order to clear the air and make SURE Bill
> Cheek understands where I am coming from)

Frankly, I don't care so long as you are
reasonably civil and don't have any hidden
agenda. You wanna buy an Icom? I'll sell
you one if that's what you know you want.
If you don't want to buy one from me, I'll
give you a list of who else peddles 'em.
Nothing emotional about it. Who cares?
Radio is what matters.

> Great. Now up until this point things are going great. We only have
> FACTS and Rich?s clearly stated OPINION up to this point.

Yeah....but there is another thread where
Mr. Well's "opinion" isn't nearly so clear
......or objective.

> >> not to mention CW. And it doesn't really have "SSB".

But it REALLY does have SSB......

>> Yep, there is no doubt that Rich is one-sided, biased,
>> bigoted AND to top it all off slanted to ICOM.

> Come on, give me a break.

Well, there is *some* doubt. I expressed it.

> Why don't you go to Rich's Web page a have
> a look for yourself (http://www.qsl.net/n2mca/).

> The man owns almost every radio currently available.

So it seems. That's very, very interesting.

> And what is this?? He actually owns
> BOTH a PCR-1000 and a WinRadio.

Does he? <Shrug> Maybe. DO you know that for sure?

> So Bill, I am subjecting YOUR reply to a "surgical dissection; perhaps
> even vivisection" because I am SICK of seeing you bully people around
> on this (and other news groups).

Huh? Say what? Are you confused?

> So folks, make up you own minds, use tools like www.dejanews.com to

Yes, indeed. Use such tools to see the WHOLE story.
Not just one sided.... That's a very good idea.
Glad you thought of it!

> back up you arguments, and try not to degrade to name calling or
> intimidation (which I am sure will be following this post).

By whom? Me? Not yet. Depends on how "SICK" you
get and how convinced you become that I am the "bully".

> I am taking a stand for the good of the newsgroups.

The newsgroups are good whether or not you see them
that way. If you are going to tromp in on a white
horse to bring salvation, it's going to be kind of
funny in a sick sort of way. Are you given to providing
free entertainment?

> I want to see them return to a place where we have
> friendly discussions and useful exchanges of information.

Nothing is stopping that. It's not possible to stop it.
Apparently you don't read all the threads. There are
quite a few where the discussions ARE friendly and
informative. They are not diminished by those threads
that appear less "good".

Oh.....if it's "salvation" you're bringing to the
newsgroup, you might oughta have a real good think
about bullying "the bullies". You know, get down
in the Lotus position and contemplate the gunk in
your navel, as the mysteries of Life unravel......

Some of these "bullies" NEVER throw the first punch.
Kinda strange for a "bully", wouldn't you say?

If you are good at reading betwixt the lines, read that
one for whatever it is worth. Might be worth a nickel.
Might be worth a hundred bucks. Depends, I guess......

And......don't forget to use DejaNews, y'hear?

"Bully" Cheek

> PRO-51.

Yeah, you're right. I was kind of oversimplifying
by meaning scanners with the Uniden label never
did 30 kHz steps.

I *think* Tandy specified the firmware for their
Uniden-made scanners....or had it done by 3rd parties.
In which case, we're not talking about a total Uniden
product.

It does get kind of confusing, which is why I
thought it better to simplify. So in a word,
if the scanner has the Uniden name on the outside,
it can't do 30 kHz steps.

If it has the Radio Shack label, or even AOR,
and if it has cell capability, then it probably
does 30 kHz steps.

There. Clear as mudd, now. :-)

Why didn't you just give him the full URL like
this: http://www.qsl.net/n2mca/PRO-2004.HTM

Was it too much trouble? Surely not. You could
have given the above URL with a lot LESS trouble
than the paragraph of text you wrote. But you
do that to everybody.....

So is there an agenda?

Or what?

You know....inquiring minds want to know. <grin>

Yeah. Rebuild it. The Hamcomm design is kind
of narrowly optimized. A couple extra resistors
and a bit of a wiring change will slick it up
just right. See the latest Scanner Discriminator
Data post I made which includes that redesign.

If that doesn't pan out, shoot me an e-mail and
I'll see what I can send your way.

NFM DISCRIMINATOR CHIPS - BASEBAND AUDIO - SCANNER DATA INTERFACE
==========

There is a growing interest in tapping the baseband audio
out of various scanners for decoding of a variety of esoteric
signals, including CTCSS, SCA, FSK, RTTY, FAX, etc. By and
large, such signals cannot be taken from TAPE REC jacks,
headphone jacks, and EXT SPEAKER jacks because of the voice-band
filtering that is done between the signal source and these
output jacks.

Therefore, it is necessary to tap the "baseband audio" directly
at the output of the discriminator chip for your scanner. Table 1
shows a list of scanners, the discriminator chip(s) used in the
scanner, circuit symbols of those chips, and three pins of general
interest on the chips: RF-Input, Scan Control, and, of course,
the baseband audio (discriminator output) pin.

Even though your scanner may not be listed below, try to find
its discriminator chip, and chances are it will be listed with
one or more scanners below, the pins of which will be the same
for your unlisted scanner! Corrections and additions to this
list are requested. See my email and other addresses at the end
of this file.

For hookup information, see just after Table 1.

TABLE 1: SCANNER DISCRIMINATOR CHIP PINS OF INTEREST

HOOKUP PROCEDURE
================

If you need the raw Discriminator baseband audio signal for external purposes, the best way to access it is via a jack installed in a convenient, unobtrusive location on the scanner.

1A BASE SCANNERS: Install an RCA or other jack in a desired place on the scanner's external case, typically the rear panel.

1B HANDHELD SCANNERS: If you can find the space, use a standard monaural 1/8" phone jack or a 3/32" mini phone jack. Some scanner are so cramped inside that even these won't fit. In that case a strip of 3 pinline sockets can be melted into the plastic case and wires soldered to the inside protrusions. The middle pinline socket is not connected to anything; it's just there as strength and support for the pinline plug you make, with the shield ground soldered to one end and the audio-center soldered to the other end: GND---o o o---NFM DSCR (audio)

"Break-apart" pinline plugs/sockets are available from Mouser, DigiKey, and Hosfelt. These little puppies are good for a lot of hacker needs, so get a supply!

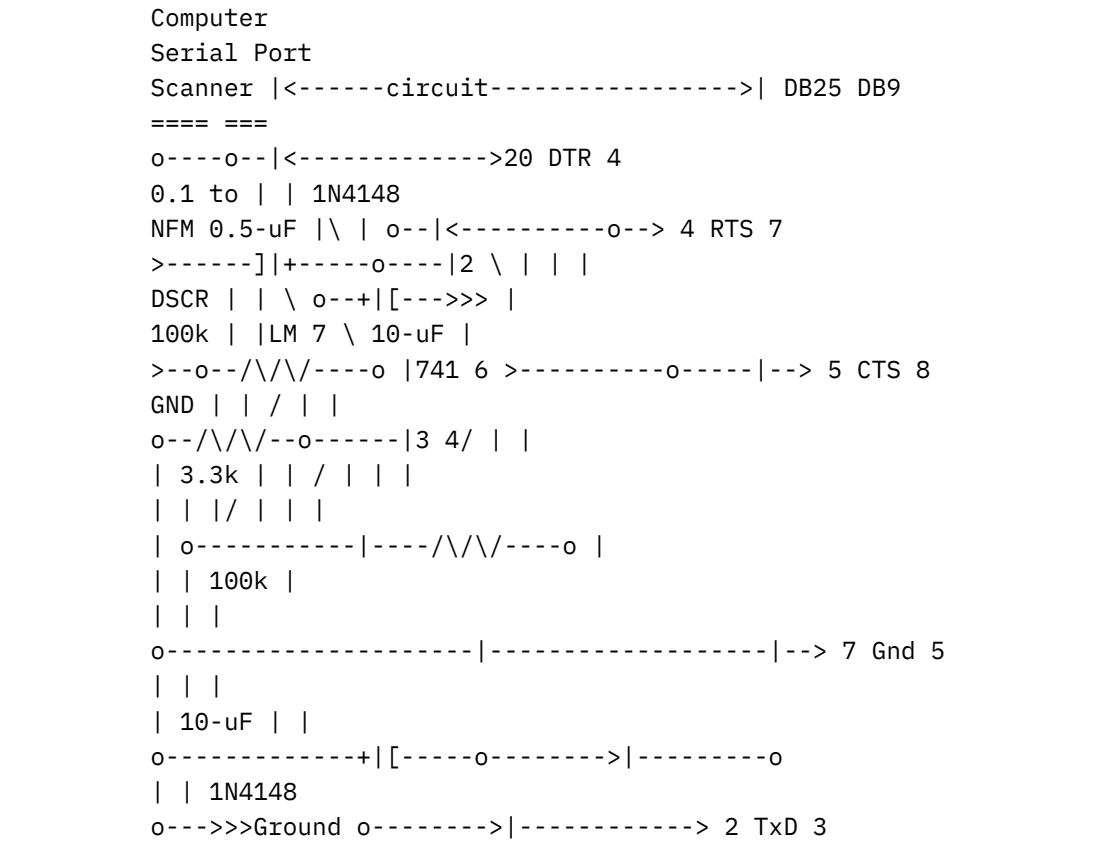
2. Connect the shell or outer frame part of the jack to scanner chassis ground. (Use one end socket for pinline connections)

3. Connect the (+) leg of a 2.2-uF to 4.7-uF tantalum capacitor to the Discriminator output Pin. (Capacitor should be tantalum, but can vary in value from 1.0-uF to 10-uF at a voltage rating of 16-35 vdc.)

4. Connect the center conductor of a shielded coax (RG-174, etc) or shielded mic cable to the (-) leg of the capacitor. NOTE: if the distance from the NFM tap to the jack is less than 3", then a single unshielded hookup wire will do fine.

5. Connect the shield of the cable at this end to a nearby PCB ground trace or spot.

6. Connect the center conductor of the other end of this cable (or single hookup wire) to the center or hot lug of the jack.



7. Connect the shield of the cable at that end to the ground lug of the jack.

8. Fabricate or buy a shielded patch cable with one end to mate with the new jack on the rear of the scanner at that end....and the other end to mate with whatever jack is on the tape recorder, processor, decoder, or whatever device is to be connected at the other end.

If you want to decode trunk control, MDT, pager, fax or other digital signals, you will need a special Interface between the NFM Discriminator/baseband audio of the scanner to the PC's

serial port. Following is a tried and true Data Interface circuit
that is good for everything we've tried, including a wide variety
of scanners.

SCANNER DATA INTERFACE SCHEMATIC DIAGRAM
Copyright (c) 1998 Bill Cheek

Computer
Serial Port
Scanner |<------circuit----------------->| DB25 DB9
==== ===
o----o--|<-------------->20 DTR 4
0.1 to | | 1N4148

10-uF	
o-------------+|[-----o-------->|---------o
	1N4148
o--->>>Ground o-------->|------------> 2 TxD 3

LEGEND:
o = soldered connection/junction
--|-- = crossover (no connection)
+|[= capacitor, polarized (see +)
>| = diode (anode->|-cathode)
|< = diode (cathode-|<-anode)
-/\/\/- = resistor
-->>> = ground

NOTES:
1. Use tantalum capacitors, +|[polarity as shown

2. Radio Shack's LM-741 works fine. Others might not!

3. Use 1/4 or 1/8 watt resistors to save space

4. Build circuit on a trimmed and fitted piece of perf
board inside a DB-25 shell for max efficiency and space
savings. DB-25 connects to PC's comport and a shielded
cable from the scanner goes to the inputs, shield is

ground and center is audio.

5. Many handheld scanner have no space to install a
phone jack for the NFM Discriminator Output. For
such tight spaces a strip of 3 pinline sockets can be
melted into the plastic case and wires soldered to the
inside protrusions. The middle pinline socket is not
connected to anything; it's just there as strength and
support for the pinline plug you make, with the shield
ground soldered to one end and the audio-center soldered
to the other end: GND---o o o---NFM DSCR (audio)

6. For base scanners, install a female RCA jack on rear panel.

7. For handheld scanners where there is space, use a 3/32"
mini or a 1/8" standard monaural phone plug.

8. Connect the interface to a comport on the PC. Plug the
input cable in to the scanner's NFM Discriminator Output
Jack. Tune to a desired signal and run the decoder
software of your choice.

This is nothing new Martin. This info has been on their Web site for a
while... The receiver is called WR3000i-DSP and the "lunch box" is
called MS8002 (or 6?). See http://www.winradio.com/home/3000i.htm and
http://www.winradio.com/home/systems.htm respectively.

Apart from that, VERY interesting information! Thanks!!!

Cheers,
Jurgen

All almost true, but:

>- External unit, reduce possibility of computer RFI
Most such RFI is by conducted (not radiated) intereference anyway

>- High sensitivity specs
No, they are quite on par

>- Lousy software, but Scancat will run it
But Spectrum Scope and Digital Suite not available.

>- Icom knows radios
So do others.

>- DSP unit available has tremendous reports
But it has limited functionality only - the Digital Suite is cheaper
and does much more.

>- Current price is a better value than WinRadio ($450-$480)
Not after you add Scancat!

Just my 2c worth...

Jurgen

It's easier to list what can't be done:

1. cellular
2. other bands
3. ?

> We already have info. on the cell mod

That's not really a "cell mod". It's the
VD mod, but it's hardly rewarding in terms
of actual results.

> but it was mentioned before on the
> scanner newsgroups that "dozens" of mods
> are available for the Pro-26.

Noooooo, NOT "available". Try: possible.

> The only other one we have heard of is the
> light mod (if you have any details on
> this mod, it would be greatly appreciated if
> you could send the info. to us!).

I'll bet. Trouble is, that (and most) mods don't
lend themselves to "being sent". We're talking
copyrighted articles, books, and other works
where the graphics, tables, and charts just don't
slide into an e-mail attachment. Besides, the
copyright owner would object......

Still, there are possibilities for conveying that
kind of information, but the first thing you need
is a service manual for that unit. Do you have one?

I don't mind telling something in so many words
or less if I don't have to spend hours drawing a
map and boring in on gory details, most of which
are readily found in the service manual.

Yes, I'm sure.

Heck, I told Faricy the same thing and he told me that I didn't know what I was talking about. Earlier he asserted that **three** of his friends reprogrammed their PRO90s to tune cellular. Now he maintains that it was done with a "programming unit." I sure would like to have one of them thar things.

"cmb" <cmb@owc.net> wrote:

> any pros or cons on which to buy??

Both are good radios. Neither one will
hurt you. The Icom is an external radio
that runs from the serial port while
WiNRADiO goes inside the PC in a 16-bit
ISA slot.

The Icom is slower than a slug; WR runs
at 50-channels/sec. Some aspects of the
Icom are better below 30 MHz where WR
excels above 30 MHz. The Icom software
is nothing to holler about, and 3rd party
software costs an arm and a leg. WR's
software is free and is continually updated
and distributed from their Web site.

If you know DDE, you can control WiNRADiO
from MS Word, Access, Excel, or other non-
radio related software. There are even some
interesting opportunities for network DDE.

Both radios have plus and minus aspects.
Whichever one is best for you depends a
lot on what you want to do with it.

There is a biased and one-sided review of
WiNRADiO on the below web site. If you can
wade through all the pretended objectivity
and see what the guy left out that should
have been included, then it might help a little.
http://www.qsl.net/n2mca/radio.html

The thing is, Icom has been around for a long
time, so some folks have an emotional attachment
to the name. If you can wade past that, then
there is a lot of information on both radios
out there on the Web.

Bottom line is they're both good radios.

That is one meaning.....yes. If he wants someone
to go to a lot of time and trouble, then he should
expect to pay for it.

Apparently you weren't able to comprehend that I
could tell him what to do if he had the service
manual. If he can understand what I mean about
switching the base of Q502, then there is no cost.

If he wants several pages of detailed instructions
with photos, charts, tables, parts lists, and
a road map that spells out everything, then yes
sir, there is a cost to that level of quality.

I don't believe you work for free, do you?

They are absolute clones except for the display color and a software/firmware fix on the 2042. In autoprogram mode, the 2035 will joyfully search the rage you put in and if there is only one active channel in the range at the time, it will put it into you open bank 100 times in a row! RS actually tried to pass this off as a "hit counter" feature until the 2042 came out and fixed it. The 2042 does not store duplicates on auto-program. The RF board is identical & even the service manual is identical except for the pages that reference the case parts & processor chip.
The attenuator (10db) is a slide switch on the back.....you'd have to be pretty fast on the trigger.

I have followed this ng for some time, and read Mr. Wells' reviews and postings, especially with regard to Trunktracker radios. Given Mr. Cheek's very inane and emotional missives, I'm not sure I trust his clarity of thinking, despite whatever technical expertise he may have. He is also obnoxious.

I just purchased a 1000i. I've had a little trouble, and sent a note to rich
asking him if in his opinion whether he thought that that I made a mistake,
as I was having trouble getting signals.. He basicly said that although
there were some things he didnt like, the winradio was a good unit, that it
should do the trick. It seemed he was being fair to me. He could have said ,
"the dang thing sucks"
but he didn't (making me feel better about my purchase).
I have found that most of my troubles revolve around my lack of knowlege.
after all, I'm a software guy, not a radio guy..

When I bought my 2004 scanner from Radio Shack, something at the time possessed me to buy the extended warranty. Best move I could have made. That scanner was into Radio Shack's repair shop more than it was at my home. After the 7th time, RS broke down and gave me a brand new 2006 scanner (the problems lasted all through the 2005 model). The time remaining on the extended warranty was made good for the 2006 also, but I never had to use it again.
Do I buy extended warranties? No. Just dumb luck that I happened to buy it for that purchase.

It's really not that great a crime, your bringing a little culture
into the news group by impersonating *famous* musicians.
I sometimes do the same when delusional and have been
Bob Wills, Tommy Jackson and Itzhak Perlmann on occasion.
I was even Nicolo Paganini for a short time until I got carried
away with the pizzicato and broke my e string! Heh, Heh!

Hey,

Just wondering what modifications can be done to the Pro-26 scanner. We already have info. on the cell mod but it was mentioned before on the scanner newsgroups that "dozens" of mods are available for the Pro-26. The only other one we have heard of is the light mod (if you have any details on this mod, it would be greatly appreciated if you could send the info. to us!). Thanks very much to all that respond!

P.S. We are still having trouble uploading the Canadian province and territory freqs. If you need any, just send us a request via e-mail and we will send them to you. Hopefully, they will be up in a few days (we know we said this a week ago).

- Don't forget to visit our award winning Canadian scanner page: http://www.angelfire.com/sc/scannercenter

On Wed, 13 May 1998 23:55:09 -0400, Rich Wells <wellsr@ibm.net> wrote:

>Greetings Fellow Hobbyists,
> I've just finished my review of the Rosetta Labs
>WiNRADiO WR-1000i receiver PC card. If you are
>interested, point your web browsers to

Gosh what a remarkable flame this simple announcement has triggered! I was not aware of these postings until today - but I have seen Rich's review earlier and had a few intelligent (I think!) email exchanges with him.

As a happy owner of both WR1000i and PCR1000, I was concerned about what I considered to be a serious bias in Rich's review and mentioned a few specific examples to him, such as his failure to acknowledge the much faster scanning speed of WR1000i (50 channels per second versus Icom's 15 or so), although Rich claims he cannot achieve it on his PC for some reason, which we did not yet have the time to investigate and will do so hopefully soon.

I also pointed out things such as that I found it very funny when Rich allocated precisely zero points out of the ten available for the lack of a battery indicator for a PC-based card! Not having known Rich before (being only a very casual visitor to this NG), this very point made me actually suspect that this review must have been ordered by an Icom dealer, as I thought that there were too many other similar points which either didn't make sense to me (as a long-term user familiar with both WR1000i and PCR1000) or, from my perspective, the allocated points seemed to err on a less favorable side for Winradio. I don't believe now that Rich's review was written to purposely harm anybody: from our email exchanges, I believe that Rich is actually very nice and tries very hard to be objective - although we do have remaining disagreements on a number of points which I consider important, we simply agree to disagree.

In addition to some points about hardware where we would disagree, myself being a professional engineer (in addition to many years of being a scannist) I can also see some fine details about Winradio which escaped Rich's attention - for example the mere fact that Winradio runs very well on Windows NT while Icom has so much trouble running reliably even on Win95 tells me something about the professionalism of the respective developers.

I could say more, HOWEVER - wait for this! - this entire heated flame might have been totally avoided! I just returned from Dayton

Hamvention and guess what I saw there: a preview of three new Winradio products!

1. WR1000e - external version of WR1000i (yes, external!)
2. WR1500i - a new version of an internal ISA card
3. WR1500e - external version of the above

The two external versions which are housed in beautifully crafted powder-coated aluminium extrusions (unlike the sheet metal Icom's box which has an uncanny tendency to rust inside - if you own a PCR1000 just open it up and see for yourself, especially if you live closer to the sea) have a couple of interesting things which Icom is lacking:

1. a PCMCIA card interface option
2. a rechargeable NiMH battery option (with in-built fast charger) which fits nicely under the receiver

The 1500 range differs from the 1000 range in two main respects:

1. extended freqency range to 1500 MHz (could be better, I thought, but better than no improvement at all)
2. proper USB/LSB with 1 Hz synthesized tuning (hallelujah)

So what's the bad news I hear you ask! I only got preliminary pricing which is supposed to be finalized once the products are available for sale:

WR1000e ... $525
WR1500i $550
WR1500e.... $600

The current WR1000i is to be continued, according to the people I spoke to, as it is "too popular to be discontinued". I have seen it being sold at Hamvention on special for as low as $420 by a few dealers or as a package deal bundled with the Digital Suite by Grove.

To my question whether this means a change of direction for Winradio, the reply was that the internal card approach will be continued in parallel as it is very popular and in fact required for some specialized applications (they did not elaborate, but implied these involved multi-channel military or government applications).
They were in fact exhibiting a lunch-box industrial PC with 3 receiver cards inside, operating simultaneously. These cards (I forgot the model number and brochure was not available) were different from either the WR1000i or WR1500i and apparently not available for sale to general public....?

Sorry, I also forgot to ask about the prices of the PCMCIA adaptor option (PC card with about 2 ft of cable and a connector at the end which plugs to the receiver) and the battery option for the new external units.

The other bad news is that all these new products now await FCC certification and are supposed to be available in approximately two

months, according to the people I spoke to at the Winradio stand (who, by the way, were nice and fun to talk to - they seem to be very dedicated to what they are doing - most of them are hams who have been turned into rather reluctant salesmen!).

I also visited Icom stand and tried to find out what new goodies I can expect for my good old PCR1000. I finally managed to speak to someone who knew a little about the product. Here the news is not so good, I am afraid: acording to him, Icom has "no plans of upgrading the product or bring out any other new products in this range until at least 1999".

Anyway, this must be the longest newsgroup posting I have ever done! Hope you will find this information of some use.

Martin

Well, true enough, it was almost blasphemous. After
all, Mister Wells does flap around on wings of white,
wearing a halo of gold, and as I understand it, he
even walks on water and jumps into his britches,
both legs at a time.

> I have had the pleasure of reading (now several) reports
> and tests by Mr. Wells, and I can only say that they are
> very useful ,detailed and objectively to the point...

If they represent what you want to hear, then
yes, that's true.

> I appreciate the _pressure_ that Mr.Cheek must has been
> under in the past (from reading this newsgroup). But I do
> have to say I feel that by posting such messages ,he can
> only make matters worse..

Ohhhhhh, sooooo I'm not allowed to post my opinions?
Show me the "allower" so's I can paste 'im up side
the chops for his time and trouble.

> Just want to say that I support Mr. Wells, and that I have
> taken great pleasure in reading his reports and tests.

Cool. Then continue to enjoy them. I'm not trying
to stop you. But I do urge you to re-read what I did
post about his glittering, golden, suave, debonaire
report on WiNRADiO. Read exactly what I said and
then go see exactly what he said. I'll bet your
sweet patooty against a kick in the arse that you
didn't read half of it. No one did. He just went
on and on and on..... Hell, you didn't fully

read what I wrote, man.

The facts speak for themselves, whether or not you
like them. Mister Wells plays politics, and dances
with fancy footwork, and plants big ol' smoochers
on babies.

Me? I don't give a shit what you think. No politics.
No fancy-dan footwork. I sink when I try to walk on
water. I get into my britches one leg at a time, all
three of 'em. And I will go on telling it like I see it,
with the idea of "pleasing" wayyyyyy down on the list.

And I don't kiss babies. They have germs put on 'em
by their parents.

Put that in your pipe and smoke it.

On 16 May 1998 19:52:07 GMT, "cmb" <cmb@owc.net> was lurking in rec.radio.scanner, and composed the following about "icom pcr 1000 or winradio??/":

> any pros or cons on which to buy??
> thanks jack n9iif

I've been tossing the same question around for a month, now. I'm leaning towards the Icom.

- External unit, reduce possibility of computer RFI
- High sensitivity specs
- Lousy software, but Scancat will run it
- Icom knows radios
- DSP unit available has tremendous reports
- Current price is a better value than WinRadio ($450-$480)

> 25mhz to 1000 mhz.. still couldnt get much..
>
> A. Could there be something wrong with my radio ??

Certainly could be. I know about three failures
out of the box.....out of several hundred. Enough
that I check 'em all before they go out the door.
Not every seller can do that, though. But then
I'm not an ordinary seller, either.

> B. Could it be as simple as puting an antenna up high ??
> I am surrounded by trees in the woods. I live way out in the country..

Could be, maybe, but I doubt it. I use that funky
little antenna that comes with the WR for bench
testing, and I never see a lack of signals.

> C. Are these radios just weak ? I mean even if I tune into
> a FM station, its is weaker than if I just used a regular radio....

Hardly. If anything, they may be a trifle too sensitive.
But there is an attenuator in the upper-left corner. Try
messing with that.

Then try comparing it to another radio, frequency for
frequency. Ferget the FM broadcast band, though. WFM
mode in most communication receivers is none too hot.
Use NFM and AM or SSM to compare. If you think there
is something wrong with it, then see if you can return
it. I have run into a couple of out and out dead ones,
and a couple more that had oddball problems.

> What could I be doing wrong??

Probably nothing.

Make sure the antenna is well connected to the receiver
and that there isn't something wrong with the connector
on the antenna and on the card. Test the DX/LOCAL switch.
And try comparisons. Chances are, you're not doing
anything wrong. If you were, you'd find out soon enough.

Test the RF Spectrum Scope, too. Use the 17 kHz RBW with
5 kHz steps and the DX/LOCAL switch set to DX. If you
don't see much, then chances are you have a defective unit.
Where'd you get yours?

Hi,

Does there exist any decoding software for Linux, which uses
the ham-com style interface?

I'm looking for a RTTY decoder in the first place, but anything
that helps is of interest.

Could somebody please point me to a source of information?

Regards,
Friedhelm

I have an item called a super converter 9001 I don't know what it is.

I got it for like a buck at a garage sale. The antenna was worth that.

any way on the front it has a power switch on the back it has two BNC connectors one is turned up at 90 degrees with an antenna on it. the other has a patch cable with a Motorola plug on the end of it. the only other port on the back is a power in port.

it's made by GRE AMERICA, INC.. Belmont, Ca 94002

any help will be appreciated.

thanks

the Pocat...

Do you have the instructions to your computer's motherboard? You might check to see if you motherboard is capable in operation in SSB mode (kind of like a SSB radio). If it can then switch it into that mode. You can often do that from the CMOS. For a very limited improvement you can get "Ferrite" filters for computer cables at RadioShack. There are also companies that make specially shielded computer cases. And even though you don't want to move your radio off your desk, you might move it to a different part of the desk or use an external antenna positioned away from the computer. I am sure that others can give you more suggestions. Good luck.

It sounds better hardware wise, and has those cool upgrade cards too. It also looks a hundred times better. I didn't want to get the AOR 8000 because it looked so cheap. I was looking at the Yupi 9000 and Alinco DJ-X10 instead, even though they had less features(desirable that is). The 8200 looks better than any other scanner I have ever seen, and has more appealing specs too.

"Robert Snelgrove" <steelgtr@ix.netcom.com> wrote:

> Can anyone tell me the difference betwen these 2?

Firmware differences in the CPU only; no
hardware changes as far as I can tell.
The firmware appears to have made it
not possible to autoprogram the same
channel more than once.

> Also, do either have
> selectable attenuation for each channel?

No. There is a fixed, mechanically operated ATT
switch on the rear chassis.

The electronic designs of these two units
are evolutions of the earlier PRO-2004/5/6
series. In many ways, they're all alike.
Which is good. Excellent sensitivity,
selectivity, dynamic range, and low-noise,
AGC-controlled front ends with doubly
balanced mixers and AGC-controlled IF
stages. All in all, good deals if the
prices are right.

There are snazzier radios out now....you know,
the kind that come sizzling on a hot platter.
But sizzle doesn't mean "steak". You can
sizzle a weenie, too. Well, the PRO-2035/2042
don't come with a lot of sizzle, but there
are some lugnuts on the wheels, that's for sure.

4831. Amusement park scanning

Newsgroup: rec.radio.scanner
Date: 1998-05-18 00:00:00 UTC
From: Sly Kapchinski <n5gqb@txcyber.com>
Message-ID: <355FC2DD.75F9@txcyber.com>
Source record: 160209
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Greetings!

I would like to hear some personal experiences/comments about carrying a scanner and/or freq. counter into amusement parks (like Six Flags).

I have done this in the past without much problem but haven't in the last few years because (here in Texas) of metal detectors now installed at the gates. Didn't know how the security personel might respond to such devices or how to explain what they are if they ask.

Lastly if anyone has any freq. info. for the following Six Flags parks they wouldn't mind passing along I'd appreciate it!

Six Flags Astroworld (Houston,TX)
Six Flags over Texas (Arlington,TX)
Six Flags Fiesta Texas (San Antonio,TX)

Thanks, Sly

Source record: 160211

If you want to listen to airshows then you have to go for the upper end in handhelds or base scanners which means a unit that will cover the 225-400 Mhz frequency range and allow a choice of AM, NFM and WFM on a per channel basis. Scanners that I know can do this are:
Portables
AOR AR8000 $550-600 New 1000 Channels
ICOM RC-10 $400-450 New until June sometim 1000 Channels
RS PRO-64 $300 400 Channels
Base
PRO 2042 $400 1000 Channels
UNIDEN BEARCAT 895 Trunk tracker $380 300 Channels useful in S. Fla
AOR 5000 $2000 Professional receiver
ICOM RC 8500 $2000 Professional Reciver
AR3000A $1000 about 400 Channels 100KHZ - 2000Mhz coverage

Gave you as much info as I know at the moment there are other Portables (Handhelds)
that will cover this range I just don't know the Brand and models of them. There is another Uniden Bearcat that can and its about $340 when I last saw it.

Simple answer for you: If you want to take your scanner anywhere like on vacation or whatever the ICOM PCR 1000 is the obvious choice. Since I don't know about WINRADIO and don't have the PCR 1000 (R10 and PRO 90 user here) I won't post an opinion on reception or any stats.

Is this addressed to me? Half-assed rebuttals? Huh? Reality to Bill.
Rebuttals? What the hell are you talking about?

> Read them all, and then you will be forearmed and
> more informed. And I won't have to reinvent the
> wheel by repeating what's already there.

Oh, you don't mind repeating in posts that Wells is biased and two-sided
but it is reinventing wheels to explain why you keep saying these things.
Yea, OK. That clears it up.

> Deal?

What is this deal stuff? I asked you to explain statements you made about
Wellls review and you turn it into rebuttals, deals and God only knows what
else.

If you don't want to reinvent wheels then quit making the same
claims/attacks/rebuttals/statements if you don't care to explain them.

Deal?

Glenn

BTW, Yes, the Icom is sounding like it may be the better of the two radios.
I don't have a spare ISA slot in either of my machines, (am concerned about
heat if I could open a slot), would much rather have the ability to take
the radio into the field with a laptop. The WR and its poor HF performance
and BFO. In reality I get the feeling both are just so so in the receiver
specs/performance and maybe I need to wait for the new radios or check out
Sony.

It's too bad that nobody has talked much about the WR with true SSB or WRe
(external 1000 and 1500 I think) and the other new releases hopefully
coming to the States in the near future. Naw, let's flame away!

4836. My thanks and more Icom PCR-1000 questions

Sorry, what I meant to convey was that the RS clone of the Scantenna is kind of flimsy & so on. I haven't seen an original Scantennal, which I would hope is made of better material.

4842. Sabtronics model 8100 frequency counter

Newsgroup: rec.radio.scanner
Date: 1998-05-18 00:00:00 UTC
From: divefox@students.johnco.cc.ks.us
Message-ID: <6jpmrc$g44$1@nnrp1.dejanews.com>
Source record: 160220

I never *quite* understood what a frequency counter was for, so I bought this one to try and find out. It seems to work, but I don't know what to do with the requencies that flash on the front panel! My questions:

What is 'gate time' and what does it help/hinder?
What does the 'attenuator' switch do, and what are the proper uses for the different settings?
Why are there 2 different antenna types on the switch ('direct' and a setting where the thing is so worn down, it's unreadable) and only one BNC connector?
What do the frequencies mean and how do I use 'em?

I think I have the rest (on/off and AC power) figured out.

This is too weird. I just blew up my PRO-43 in precisely the same
manner! The backlight works, a pop is audible when the scanner is
powered up, but all CPU functions are dead. No speaker audio, no
LCD activity, etc. The most I can make of it is the AA batteries
I temporarily placed in the scanner (to replace rechargables that
had gone dead) forced too much juice up the scanner's yingyang.

Your friend wouldn't have been at the San Luis Obispo, CA train
terminal when this happened, was he? Maybe if he was, we could
pass this off as The Curse of The Amtrak Conductors Who Hate Train
Passengers Listening to Their Personal Communications. <g>

> Can anyone tell me the difference betwen these 2?

As published in an issue of Monitoring Times, the 2042 is
a 2035 with the following changes :
1. backlight changed to amber
2. rotary tuner speed increased 3x
3. empty channels are automatically skipped
4. added 200 search pass frequencies
5. auto-store will not store duplicate frequencies
6. attempting to program duplicate frequency gives warning
7. can sort bank frequencies in ascending or descending order

> Also, do either have selectable attenuation for each channel?

Nope. It's a switch on the rear panel.

Darrell 7 Bob,
Commtel is really another name for the Radio Shack line
of scanners sold in Europe. That means you're just getting
a clone of a Uniden or GRE radio usually sold in the Tandy
shops. Your COM216 is the BC3000XLT that takes AAs instead
of the ni-cad it "normally" comes with. Netset is another
well known name in Europe which, again, is some form of
rebadged Radio Shack/Tandy model.
The COM205 does appear to be the late PRO-2006 made
by GRE and is offered by a few of the European dealers
such as SRS Trading.

I have heard a local PD narrow in on a lojack signal.
It was humorous to listen to the new officers and thier
first time using the lojack receiver. I had already been
listening to the signal for about 10 mintues when I heard
one of the officers call dispatch and report he was getting
a lojack hit. The signal is less than one second long, it's
a data signal and it repeated about every 10-20 seconds.

Happy hunting

4850. Pro 2042 sensitivity (UHF & 800)

Newsgroup: rec.radio.scanner
Date: 1998-05-18 00:00:00 UTC
From: jcr1434@mars.superlink.net
Message-ID: <6jpqhqsol1@earth.superlink.net>
Source record: 160228

I am disappointed in my 2042's sensitivity on the UHF and 800 MHz bands. Is there anything I can do about it, or did I get a bad radio? I bought the radio used by mail, from a
scanner store/ repair shop, and had an OS535 installed.
Using the stock antenna, I can just barely receive signals from my municipality's 800 MHz Trunked radio system, whose tower is aprox 3 miles away, line of sight. Plugging in an antenna from a 2 way radio on that system improves reception slightly. I can also easily squelch the signal from a nearby (WA2WSK, ~1.5 miles line of sight) powerful UHF ham repeater,
which I *can't* do with either of my portables.
I have tried switching the attenuator (the above was with it set for 0 Db, not 10) and using computer control versus all nearby computers off, with no improvement. VHF-high reception is mediocre, and VHF-low reception is rather poor under the same circumstances, but
UHF and 800 are the worst. In all bands, it is much, *much* worse than my BC200XLT and Pro 64
with their stock antennas.
Does anybody have any suggestions? From what I've read here, the 2042 ought to be performing better. Did I get a bad radio, or does the 535 cause this? I can upgrade the antenna, but it must remain a smallish indoor job.
TvmIA,

-James C. Robbins, Jr.

Jason,
Version 2 still has a little work left to finish but it's about 99% ready to go. Right now I am working on getting web space and my own web access so I can put it up. I'm still recovering from the Enterdev fiasco, so it'll be a while. I hope to have a new site up by the end of June. A DOS version is also in the works in case you have an old 386 or 486 laying around, but it's nowhere near ready as of this writing.

I'll be glad to answer any questions, but please direct them to this NG rather than my email, as I don't have access to it yet..

Thanks,
Phil Smalley

there is a modification to expand the recieve thru, or near to, the
entire 800-900 mhz range.this WILL NOT work on scanners having a
serial number 4500 series, or greater.

to proceed... remove the bottom cover from the scanner. locate the
small circuit board at the lower right hand corner. locate and cut
SILVER WIRE JUMPER L201. reassemble the scanner.

your friendly neighborhood rf outlaw.....pc

The manuals for the 2 versions are so nearly identical, that you should
not worry about it-the only major difference between them is that the
20-145 has a backlight dimmer button, while the 20-145A has a backlight
on/off button.

You can certainly take the PCR1000 anywhere but you will have to take a
laptop with you to control it, this makes it less than ideal for
portable use. It is however very good and I have one. I did not get
Winradio because the inside of a PC is the wrong place for an HF radio.
I know how to build a radio to work well inside a PC and the Winradio
card I saw was not.

I think you have a broken radio. My 2035 isn't as hot as some other receivers I have around, but it is not bad at all. It sounds like the bandpass filters might not be switching properly. At any rate, get with the place where you bought it. It's remotely possible that any number of tiny things could have happened when the board was installed that could cause your problem. It would be easy to miss this problem when testing the computer board install. I'm sure others will chime in too.

There is more to listen to in the Twin Cities than the Minneapolis police and fire dept. A good starting point is the Minnesota Radio Monitoring Page on WWW:

http://home.att.net/~emw-1/mmp.html

If there's something you're looking for that's not on that page, E-mail me. I have an extensive list of frequencies for the area, especially for the St. Paul side of the metro area.

I haven't had the same problems with my PRO2042 (also with an Opto). It's hard to say what might be the problem based on the info at hand but a couple things to consider are 1) replace the stock antenna, which is worthless 2) move the scanner to a different location to verify whether it is a problem with the radio itself.

I doubt that the board could be the cause of the problem but I'm sure there are plenty of other more technically astute people than I who could say for sure.

I can't recommend a smallish-indoor antenna, but I would certainly try that before giving up on the radio. I've had mine for a number of years and while it is not the most sensitive I own, it performs very well.

Hi,

We will have a small shipment of the Sony scanners in our store on Tuesday, May 19th. I will post my initial impressions of the scanner Wednesday on this newsgroup. However, in the meantime, you can read an extensive review of it by Jeff Goldman on Rich Well's web site which is at www.n2mca@qsl.net. As for pricing, I won't be setting a final price until I see how many units I get in, so if you'd like, you can phone us at (650) 573-1624 late on Tuesday, May 19th for pricing.

4872. Scanners for sale

Newsgroup: rec.radio.scanner
Date: 1998-05-18 00:00:00 UTC
From: Tom DiFrancesca <thomas@etsc.net>
Message-ID: <3560D349.521E@etsc.net>
Source record: 160250

I'm changing hobbies and wanting to sell my equipment. Please email me at "thomas@etsc.net". The prices include shipping via U.S. Postal Service in the USA, I won't do C.O.D. but I will accept Credit Cards (MasterCard and Visa).

Realistic Pro-34 w/800 mod, good condition, comes with rubber antenna, power supply, and instructions - $145 firm.

Realistic Pro-2050 "Trunk Tracker", 300 channels, manual, antenna, power supply, almost brand new. - $210 firm.

Uniden Bearcat 120XLT handheld, 100 channels, rubber antenna, power supply, no manual. Very good condition. - $125 firm.

DX-394 Digital Shortwave Receiver, brand new, manual included, - $210 firm.

I've also got one of those "Gotcha's", it's a video capturing device that you connect to your parallel port and capture images from a camcorder or VCR. Brand new in box with manuals, software, and cables. I'll sell it for $65 firm.

Again, these prices include shipping in the USA and I can take Mastercard and Visa, I am not a dealer or retailer but I have a merchant account - you are actually safer using your credit card - you've got consumer protection by using it.

Best regards,

Tom DiFrancesca III
Clovis, New Mexico

Not sure how to explain what the gate speed is but you can use the frequency counter to find the frequencies of VERY NEARBY (depending on model and quality) transmitters. It can also be used with other accessories to tune radios and such. The frequencies that flash usually have no meaning until one is constantly on the display (that would be the freq of a nearby transmitter. try putting it near a cordless phone that is turned on you will see what i mean). The attenuator is used for the sensitivity of the device. The one BNC connector is for an antenna for testing and i would think that the other one would be for an antenna with an impedance other than 50 ohms. Hope someone can help more/criticize what I have written here and I hope this helps you as well.

i have a pcr-1000...hooked into a sound card.

Did you use a stereo to mono plug adapter....the sound card is stereo.

Did you install it in the line input jack.

Did you check the mixer setting to make shure there turned on and in proper balcance.

Are you using a awe64 or what type of sound card.

Did you make sure the volume is up on the pcr-1000 and it not a squelch problem.

See ya

Hello ... I am interested in buying a used or new scanner
to put in a pickup truck ....I would be listening to about 30 company
frequencies ....but would like to have a scanner
that will search out new (active) frequencies . What is a good scanner for
this type of use ??

Charge in Ruby Ridge Case Dismissed

.c The Associated Press

BOISE, Idaho (AP) - A federal judge Thursday dismissed involuntary manslaugher charges against the FBI sharpshooter who killed the wife of white separatist Randy Weaver during the 1992 siege at Ruby Ridge, Idaho.

U.S. District Judge Edward Lodge accepted the Justice Department argument that Lon Horiuchi was acting in the line of duty when he fired and was protected by the Supremacy Clause of the U.S. Constitution, which keeps federal agents from state prosecution for actions within the scope of their job.

Boundary County Prosecutor Denise Woodbury charged Horiuchi last August with firing the shot that went through the cabin door and killed Vicki Weaver as she held her baby daughter.

It was the third death in the 11-day standoff that began when federal marshals tried to arrest Weaver on a gun charge at his isolated mountain cabin. They encountered Weaver's son, Samuel, and his dog, and an exchange of gunfire left the 14-year-old boy and Deputy Marshal William Degan dead.

Woodbury maintained Horiuchi acted negligently. Horiuchi contended throughout that he was following the procedures set out for dealing with the Ruby Ridge confrontation. The unusual ``rules of engagement'' told federal lawmen to fire at anyone moving around the Weaver cabin.

Woodbury also charged Weaver's friend, Kevin Harris, with murder, but that charge were dismissed. Harris and Weaver were acquitted in an earlier federal trial on charges of killing Degan.

> So when are you posting YOUR side by side review Bill?

I'm not. No sense in it. There is enough
information floating around and anything I'd
contribute would be a waste of my time.

Know what I mean?

> How long have you owned an Icom?

Ohhhhh.....a long time. 16 years, maybe.

> How long did you keep it?

16 years. Oh...you mean the PCR-1000? I don't
own one. Had some come in and go out long enough
for a bench test.

> If not at least post a rebuttal to the biased
> parts of Wells review. I have read his review twice now and
> don't see any major flaw or "pretended bias.

Well, I posted two and related to a third and more
posted by someone else. You can read those. If
you don't agree, that's fine. I don't get paid or
get any remuneration for my opinions. So they're
free and as I see it....when I have the time to
mess around with that sort of thing.

> I don't own either radio but I
> just can't see what is sending you off
> in this direction. Clear it up.

I'm not. I just told the Water Walker what I
thought of a couple of salient points, and it sent
him and some others off into LEO.....you know,

the ozone layer.

> How does one see what should have been included Bill?

Read the posts. All of them. Don't pick and choose
just to gather ammunition for half-assed rebuttals.
Read them all, and then you will be forearmed and
more informed. And I won't have to reinvent the
wheel by repeating what's already there.

Deal?

maskiel@my-dejanews.com wrote:

> > I don't believe you work for free, do you?

> As A matter of fact...Yes sometimes I work for free.

Yeah....ri---ght. Like for your employer?
Maybe your church. Maybe your knitting club.
Maybe to pull someone out of a snowdrift or
help them change a flat tire..... but we're
not talking about those kinds of things.

> I would help someone with
> anything I could if I was
> capable. What would you like?

Ohhhh, you can start with money. It's got a
fairly universal value. What else are you
capable of?

> I am sure that you worked for all the information
> that you have gathered from the fields.

It would surprise you to know just how MUCH I've
worked for everything I have. No silver platters
here. But information is relative. No one gave
me my degrees and certifications.

As for hobby information, well....my hobby and
profession are closely entwined. And no, very
little of it came for free. A cell mod here
and there for radios I'd never seen, sure.
Tidbits. Bits and pieces. You betcha. Nothing
that amounts to any significance. No matter,
because I've given back ten-thousand times more
than I've gotten......which is just fine with me.

On the other hand.....

I went to school and/or worked my ass of for
most everything I have, tangible and intangible.
I used to bitch about it in my early years. Now

I'm damn proud of it.

But we're not talking about the kinds of things
that amount to acts of kindness or rendering
aid in emergencies or dire situations. Those
kinds of things are givens. We all do them.

Here we're talking about something a lot different.
A quick check shows no one on this newsgroup has
asked you for any kind of help. Between here and
my e-mail box, I reply (with substance) to several
hundred, maybe even a thousand requests a month.

Sorry, pal....but it is not possible for me to
give each request a ream of papers or an hour
of my time. Each piece of mail costs 32-cents;
and add a nickel for the envelope and paper, and
a few more cents for the ink and other consumables
it takes to do a sheet of paper. And you think
I should GIVE IT AWAY? I can't afford to subsidize
other people's leisure pursuits, man. I can barely
afford my own.

Instead, I do what I can do....in
a manner that is efficient and cost-effective
for me. Basically, that's a deal where I best
help those who help themselves. If you and me
are looking at the same schematic diagram, I'll
tell you anything you want to know about it, in
so many words or less. And let you fill in the
blanks. If you are not willing to go that far,
then you have no use for me; nor I for you.

Nothing emotional about it. There are too many
people as it is, who are willing and capable of
helping themselves. So it is a pleasure to work
with those kinds of people. There aren't enough
hours in the day to get through all of them, much
less the freeloaders and half-hearted give-a-hoots
who are here only for the beer, so to speak.

Now do you understand?

All duplicated and corrupted messages are ignored and will not appear in the log file. This new log facility works independently from the SkySpy database where messages are stored as usual.

If you have a previous SkySpy version you can get a free upgrade from
the Pervisell web site. Download the zip file at
http://www.pervisell.com/ham/skyspy11/upgrade.zip

Unpack the archive and copy the files to the SkySpy directory.

If it's the TS-2 maybe the problem with the keypad is with the
Memory Lockout Switch in the rear of the unit. Slide the
rear-panel memory switch to the left (away from center)
to lockout access to memory. To change frequencies, slide the
switch to the right and then re-program. Also maybe all the
channels are locked out. Maybe there is a strong birdie on
the priority channel and priority is turned on. Hope this give you some ideas.
Let me know how you made out.

Uniden Bearcat BC 100xlt Handheld Scanner

Features: -New NiCd Battery Pack
-(1) VHF Rubberduck Antenna
-(1) UHF Rubberduck Antenna
-Earphone (extra length)
-Wall Charger
-Original Case

Radio Features -100 Channels
-10 Ch./bank, 10 banks
-Weather Search
-29-54, 118-174, 406-512 Mhz
-Band Search

The radio has had some use and I'm proud to say, I've taken good care of it over the years. Everything works perfectly.

I'm asking $100.00 firm for this beauty. It is a very useful radio and will give you years of quality scanning.

Please EMAIL me or CALL me at (305)895-4355 between the hours of 10:00am & 9:00pm.

73,
Bill

4909. New Public safety trunked system

Newsgroup: rec.radio.scanner
Date: 1998-05-19 00:00:00 UTC
From: Edward Tobiasz <edt@accesscom.com>
Message-ID: <35618E88.6BAA@accesscom.com>
Source record: 160117

The City of Turlock California has filed for a 800 MHz trunked system
license with the FCC.

The system parameters are:

Frequencies
821/866.6125 MHz
821/866.8375 MHz
822/867.4500 MHz
822/867.7125 MHz
823/868.2500 MHz
823/868.6250 MHz

20 control stations
550 mobiles

Station to be located at coordinates N37-29-37 W120-50-51

Any info on operation will be appreciated.

Regards

Ed

Hey there...

I have for sale or trade a pair of Motorola Spirit VHF Monitor Revievers. They are dedicated frequency recievers, which are currently set to 138.325 MHz, but can be set to anywhere 138-174 MHz range (these are not some garbage analog recievers, they are PLL type with no frequency drift). Physicly they look like pagers, but have a speaker, volume control, etc, and are very small in size. Excellent for monitoring a specific frequency, such as a 2 meter repeater. Both come with rechargeable NiCAD batteries, plus a charger for the batteries. Will take best offer or trade for other radio equipment or antennas (would you have something like a 2 meter Mag Mount antenna?) E-mail me, we'll work something out.

Source record: 160124

Ok, Here's the deal. I'm new to this group and am sick of jabbin each other..

I want to know more about this here winradio.
Actually, If the API or command set was available, I would have prob purchased the ICOM, but its not. So, I bought the winradio. I've been quite pleased. Most of my problems were due to my lack of knowledge. I actually bought the dang thing just to do a simple project of transmitting an FM radio station over the web, but have had a heck of a good time tuning in stuff from all over..

I read the review and got a little scared about my decision. I wrote the author and he made feel as though I made a good purchase.

After getting familiar with the thing, I can say I would buy it again.

Anyway, can I start a new thread ? One that simply discusses Winradio? I dont care who's better anymore.. I don't care who's the bigger jerk. We are all a bunch of jerks <G>

Has anyone written some cool apps with it ?

Also, has anyone heard of a morse code decoder that uses a sound blaster ?? It must be possible using the DSP onboard.

Thanks !!

Orange County Disaster Response Group Needs Volunteers

The IMPACT DIsaster Response Unit based out of Orange County, California is looking for volunteers to help staff its unique and one-of-a-kind Disaster Response/Disaster Communications Unit. The IMPACT Unit is a mutual aid/mutual support groups that works with all public service agencies, cities, and other organizations like the American Red Cross, REACT Teams, RACES groups, ARES groups, and many more.

No training or equipment is required. Just the need to want to help those who live around us.

We have training classes set-up in first-aid/CPR, basic search & rescue, disaster preparedness, communications at a disaster scene, amateur radio workshops, advanced first-aid/EMT First Responder, and many more.

The IMPACT Disaster Response Unit utilizes all radio bands including: Amateur, GMRS, CB, FRS, Cellular, Business/Commercial Bands and many more.

For more information, please send e-mail to sct_impact@bigfoot.com

Check out our web page!

<CUT>

Take a look at the Toronto Police frequencies. ALL the VHF
frequencies you have listed have not been used for some 4-5 years!!!

The Mitre ones., the ISS and MSS etc......

North York Fire
Scarborough Fire
Etobicoke Fire
East York Fire
Mississauga
Brampton

Are all out dated. Very very out dated.

The Media frequencies are wrong, CFTO, Toronto SUN are on 900mhz
trunked.

Hum..... Well at least your not copying material from others!

Hello!
Can anyone recomend a good scanner that is capable out of the box to scan straight thru a wide range of frequencies, or can do so if modded. I would like as much scanning range as possible, with little if any gaps. As you can probably tell from this post, I am new to the world of scanners. I would also like a handheld model in the range of a few hundred dollars. Thanks for any light you can shed on this.

I went to your Ottawa page, and found various examples of outdated
material. One example you list 163.7400 as Sherwood Studio, this
company closed down in 1990, in fact the frequency is a RCC frequency
is owned by Christie & Walthers, and it has several companies on it.
The second "Sherwood Studio" frequency is their simplex channel, which
was printed in Haruteq Ontario Scanner Book as a check of their listings,
ie: if someone else listed that frq. they took it from Haruteq.

The other examples is the listings for Nepean, Gloucester and Ottawa
Police. These Police Forces NO LONGER EXIST, they were all merged into
the Ottawa-Carleton Regional Police Services, in 1995. They are on an
800 Mhz EDACS trunked system, all of the VHF frequencies are not in
use...

If you're all hung up on that, then get down
on the first sentence of the above paragraph
and munch down on that. I mean, TRY....really
TRY....to understand the first thing I say.

When you won't even bother to try, that elicits
what you call "nonsense". Don't START the
nonsense and you won't get any in return. Simple.

I don't need to explain. The explanations are already
posted in the threads. I'd just as soon advise you
to go get something to eat as to repeat myself.

> > > If you don't want to reinvent wheels then quit making the same

> So a question means you have to force feed answers?

Well, I dunno. Ask a specific question and we'll
see. Don't ask me to explain what has already been
explained. Go read it for yourself, and then if
you don't understand something, ask about THAT.

> The questions were framed Bill

And they were answered, Glenn. In advance of your
asking, by the by. All you have to do is READ.

> and all you can answer is with this force feed stuff.

Well, I'm not going to repeat myself. And
you're not going to read what's been posted.
So best I can do is prescribe something for
your upset gizzard, I guess.

> Count up about 6 or 7 lines and there is one of
> the questions you seem to ignore.

To explain? I already did. You won't go look
at the answer, and I am not....what part of "not"
do you not understand?.....going to repeat myself.

> > > BTW, Yes, the Icom is sounding like it may be the better of the two
> radios.
> >
> > Then go get one. Or two....

> That seems like an odd statement Bill.

Yeah. Everything I say seems odd to you, Glenn.
So go put on the frying pan and cook yourself
up a hamburger and fries.

> Are you saying every time YOU see a
> product that might be better than another you run out and but two of them.

Does it LOOK like I said that? Where? Do
you have some sort of a reading comprehension
problem?

> Strange advise/behavior to say the least.

You have been very strange lately, that's for sure.

> > > I don't have a spare ISA slot in either of my machines,

> > Sounds like a personal problem, actually. I mean,
> > I can't just shit you one, Glenn. Go find an old
> > motherboard somewhere and superglue a slot in. I
> > don't know how to solve that problem for you.

> Wow, now we got you swearing Bill.

Swearing? Where? I don't hardly ever take oaths
anymore. No sense in it. Where and when did I
swear to something?

> No, not a personal problem Bill.

Well, what kind of a problem is it, then, Glenn?
It ain't MY problem that you don't have a spare
ISA slot. And I can't see that it is a professional
problem.....so it must be a personal problem of yours.

> You see I was making a statement about my circumstances

Pitiful as they are? Were you looking for
sympathy and pity, maybe?

> and why the Icom might fit in better than the WR.

Well, that isn't valid. You can solve your own
personal problem in several ways. Free up an
ISA slot. Build or get another computer. Or
just whine some more and maybe someone will give
you an ISA slot and some superglue to glumm it in.

> People do that in discussions Bill. Why did that
> throw you into a cursing fit Bill?

Cursing fit? Now it's cursing; not swearing? Where
is the fit? I still can't shit you an ISA slot,
Glenn. That's a problem you have to solve on your
own. Or else go get an Icom or two..... or the new
WiNRADiOs that fit a comport. You have lots of
choices, Glenn. But it's easier for you to diddle
around with me, huh? You sure as tootin ain't
going back to the threads to read anything, and
you're not even going to go get ONE Icom, much
less anything else. So there is no point aside
from asinine rhetoric in what you're ruminating.

> > > (am concerned about heat if I could open a slot),
> >
> > Why? When has heat ever been an issue in a PC?
> > It's ruminated about a lot.....but there sure aren't
> > many, if any, substantive issues of heat aside from
> > cooling the microprocessor, maybe.

> Aside from? Gee, maybe that is a concern of mine.

Oh. I see. You're concerned? Why? Are you
running a 50-watt power supply in a 300-watt PC
or something?

> You don't know what kind of computer I am running

Well, you are making it easier to see what kind.
Obviously, it's underpowered and missing some
lugnuts, fromt the sound of your drivel. See, I
can read into your spew, too, pal. Two can play.

> and worse yet you don't have a clue as to what
> cards I have in it. Off the hook again.

Sounds to me like its a deck of 51 cards, missing
the meatball of spades, maybe.

> > > would much rather have the ability to take
> > > the radio into the field with a laptop.
> >
> > Yeah, right, with a car battery strapped on
> > your back and an antenna mast anchored in your
> > sweet patooty? Ummmmm hummmmm. Ri--ght.

> Uh gee Bill, some of us own cars, RV's and the like.

Yes? So? You don't even own a laptop computer.
But even if you did, you're going to lug all that
paraphernalia just to sit in front of the campfire
and play radio? Yeah, ri--ght.

> Ever heard of camping?

And computing at the same time? Yes. But YOU
ain't gonna be doing it.

> The above is such a desperate attempt at making a feature the WR can't do
> sound insignificant.

Well, there are WiNRADiOs out now that CAN do it.
But even the old WiNRADiO can run off a PC from
a DC-AC inverter. Which would be about the same
degree of an issue as traipsing out into the woods
lugging that Icom and all it's paraphernalia.

> Guess what Bill? I have operated field day for years
> with no problem. Camping.

Sure. So?

> Yes, the 50 foot 12 gauge feed off the car
> battery does work, so do the gel cells in the tent trailer.

Yes? So?

> Also the gel cells in the pack. Try again Bill.

Try again what? If you do with that Icom all you
claim, and I suppose you *could*, you'd still be
one out of a thousand. It would make no impact
on the marketability, however...aside from a
tenth of a percent, tops.

> > > The WR and its poor HF performance
> >
> > How do you know it's "poor"? You ever try one.
> > "Poor" is relative. But if you think it is "poor",
> > then don't get one. Get an Icom and be happy!

> BFO's and strong images on HF is what I have heard.

You heard..... from the Water Walker, no less.
Whoopee. Rah! So go buy that slug of an Icom.
But I bet you won't.

> You a seller of WR can only tell me to buy an Icom.
> Good rebuttal, slick sales technique.

Honest? I wouldn't want to sell you something
that you doubt or aren't convinced of. You sound
convinced on the Icom. So I will sell you one of
those, instead. Or tell you where you can buy one
from somewhere else if you don't buy from me.

No skin off my nose, pal. But then I am different
from other sellers. I figure a product should sell
itself. Last thing I'd want to do is peddle something
that a body didn't want. Or need. SO if you think
the Icom is the better value, then go get one.

Or two.....

> > Enjoy traipsing around Tacoma with a 40-lb car
> > battery strapped to your back and that Icom
> > glummed to your belt.

> Why in the hell would I do that?

I can't imagine.......

> What do you need a 40-lb battery for anyway

I dunno.....why do buck-toothed, pimple-faced
hams boogey around hamfests with propellers on
their beanie caps? I just don't have an
explanation for some things.

> > Right. Whatever turns you on and shickles the tit
> > outa you. If you like to wait, then wait. If you
> > like to hurry, then hurry. For all I care, you can
> > hurry up and wait. Know what I mean?

> No I don't.

I'm trying to tell you that I really don't care
what you do or what you think. Those things are
YOUR business and it ain't my business to alter
your path through Life. You are not open-minded,
so I have no interest whatsoever in changing that.

It would be fruitless to try. Kind of like peeing
into the wind. It's dumb to do that. It's dumb
to try to change your mind.

So go buy the Icom and be happy! That is what's
important.

> I see you have gone to great lengths to talk about food,

Not a pleasant subject? You seem to want to bore
into unpleasantries. I prefer the former.......

> assumptions and make cute little phrases like the one above but nothing to
> address the WR or the Wells review.

I already addressed all that I am going to address.
If you don't want to look it up, don't. But you're
not going to alter the flow of my path through life,
either. I plumb don't give a shit what you think of
WR and Water Walker's review. I said what I had to
say about it and it's all there in black and white
for you to read....or not....as you choose.

GO GET THE ICOM, Glenn. It is the *best* radio
for YOU. I already can tell that. WR is not for
you. Simple.

> > > It's too bad that nobody has talked much about the
> > > WR with true SSB or WRe (external 1000 and 1500 I think)
> >
> > Well, so far those units as well as the WR-3000i
> > aren't certified for sale in the USA, so there is
> > little sense in beating our gums about them.

> I know, tater talk and nonsense is better.

Well, ask a specific question, and if I haven't
addressed it before, then I'll do my best. But
I ain't playing any funky games with you, pal.
Or, if we do...then I will call the shots. Not you.

> > You wouldn't like what I had to say anyway, so I'm
> > not all that inclined to waste my fingertips just
> > to give you something else to snivel about.

> Snivel? You are the one slinging insults.

Oh? Ri--ght.

> As far a wasting your fingertips, yea, shickles and
> taters are your idea of productive typing,

Let me see even ONE example of YOUR productive
typing. You NEVER post anything of value. Allowing
for a rare exception, your mission is to needle,

poke, and prod. You NEVER simply participate in
discussions. I do. And the track record is there.

> ehh?

Eh?

> > > and the other new releases hopefully
> > > coming to the States in the near future.
> > > Naw, let's flame away!
> >
> > That's what you're shooting for anyway, so a spade
> > might as well be called a spade. No sense in liver-
> > lipping and mincing words, now is there?
> >
> > Give it your best shot, eh?
>
> No Bill it was sarcasm pure and simple.

Well? Is there that much difference betwixt sarcasm
and flames?

> You have nothing to add to the
> technical side of the discussion

And you do? <giggle>

> to you just unload on anyone that dares to
> imply the Icom might be the better radio of the
> two or even have better features in any area.

Unload? Geezus H. Kriste, man, I've advised you
forty times now to go get the friggin Icom.
Sheesh! I don't want to sell you a WiNRADiO.
I don't want you to have a WiNRADiO. I don't
want to convince you of WiNRADiO's merits. I
think you would be best served with the Icom.
It is a good radio....and of the two, it is
best for YOU. How much plainer can I get?

> Again Bill, where in Wells review is this
> "pretended bias"?

It wasn't pretended. And it was prima facie.
Already explained. Read the threads.

> I have read his review twice now and
> don't see any major flaw or "pretended bias".

Cool. Then YOU are "right". So go get the ICOM!!!

> You said it and I am asking
> what you mean by that.

I already explained that in crystal clear English.

> You need not include me in your answer.

I didn't need to. You can include yourself
by reading it. Or not.

> I didn't write the review and I didn't say it was
> flawed or contained "pretended bias". You did.

I didn't say that he "pretended" any bias.......

Poor filtering and lack of proper screening, it was a limited view at an
exhibition rather than a bench test. My suspicions were confirmed by a
friend who had one for review, since it was supplied by a retailer
wanting a positive report he declined to provide a review for
publication and returned it.

Like I said in my previous post, his list looks like the 1989 Haruteq
book. He has all the old Ottawa, Nepean, and Gloucester police freqs,
even though those forces don't exist anymore.... For Eastern Ontario
I prefer Dean Hoisak's site at:

http://www.achilles.net/~dhoisak/freq

It is very up-to-date, and it even includes info on the EDAC 800 Mhz
trunked radio system the Regional Police service uses...

I didn't see a price for the black box receiver or the trunking add-on either.
I wonder why the Opto guy decided to advertise the site when they are not ready
to provide that critical bit of info. Perhaps they're not really ready to sell
it yet but mainly intent on piquing our interest.

Maybe testing the water? He's probably watching the hit counter very
closely as he decides which end of the "window" the price will fall toward.
Can't blame them, there's no doubt a few pennies invested in development there.
Wonder if they'll offer the front half alone so one could fit it to a
surplus 2035/2042 RF section? Probably not but I can hope....
At any rate it does look intriguing if the price is right in relation to
others on the market.

BE careful with Radio Shack special order batteries. You often get the
"internal batteries" of the batt pack, which is no help if you need the whole
"slide on" pack.

I bought a sport cat (the black one to keep a low profile ;).

so far I'm very displeased with the unit. It just doesn't receive very well at all. I had to get as close as three miles from our local airport for it to pick up ATIS. with the squelch full open. I've set it next to my old 16 chan. bearcat scanner. I programmed in the same freq.. into both units and turned 'em on side by side. the old unit put it to shame even after I went to radio shack and picked up a scanner antenna and connected it to the sport cat. Is this unit truly just for sporting events. or is it my luck of a bad scanner? Has anyone had a similar problem with the sport cat?

thanks for the input

Well I have owned a sportcat for a couple of years now, and haven't
experienced any problems that you are mentioning. I will concede that
the Sportcat may not preform as well as some higher end model scanners,
but it deffinitly does better than my BC147xlt. Part of your problems
might be due to location of the scanner or location you are trying to
monitor. Differnt scanners will preform differntly in varing
circumstances. Hope you have better luck and are able to enjoy your
scanner.

I'm curious about this too. I took my scanner with me up to Hershey Park recently, but stopped short of actually taking it inside the premises.

Not to change the subject, but I'm also interested in hearing about park policies toward two-way radios, particularly the new Family Radio Service units. A friend of mine sent an email inquiry to Hershey, but we never got back a reply.

Try using the scanner as a stand alone unit (without using the
OS535 interface), If the sensitivity improves, you have a bad OS535.
I had the same problem with my OS456, the sensitivity was terrible.
It was as if there was a HUGE attenuator in line with the antenna.
I called OPTO and spoke to a tech, (Ken) and he had me send
the unit back to get tested......to make this quick, OPTO replaced
the board without any problems. I installed the new OS456 and PRESTO
the scanner works great

Does anyone know how to get rid of computer interference on my scanner?
I have a 2006 and I get noise and garbage from my computer. (Of course they
are on the same desk - but I use the computer for recording etc) Any ideas
besides moving the scanner from computer?

4952. Re: Commtel 205 = PRO-2006

Newsgroup: rec.radio.scanner
Date: 1998-05-19 00:00:00 UTC
From: Knut Otterbeck <otterbec@online.no>
Message-ID: <3560D6B7.CD9F2551@online.no>
Source record: 160175
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi Robert,

This is just my 2 Cent's worth (or whatever ..:) ,but I do
have to point out following concerns on Commtel's :

GRE/Japan manufactured the RS2004/2005/2006/2035/2042 line
of base scanners. GRE; generally speaking quality products!

The 2005/2006 standing out as "state of the art" regarding
functionality and quality of the receiver components,etc...

The CommTel line of products are allmost certainly produced
outside of Japan, and probably _not_ by GRE...

If the CommTel's are produced in China or similar countries,
odds are that the components are of lower quality...

Also ,I have heard that CommTel products have been having a
hard time getting proper certification (for sale) in Denmark,
for instance... This supposedly has something to do with the
EU (European Union/Common Market...) from what I have heard.

One very important issue you should ask the vendor selling
the CommTel 205 is if it is 100% compatible with the OS456/
456Lite computer-interface board from OptoElectronics. If it
has no possibility to interface with a computer, then it is by
no means similar to "similar" GRE/RS products ...

(Please be informed that the OS456 is allmost impossible to
buy today,stocks from OptoElectronics are very limited, but
the 456Lite is still in production...

Can someone please try elaborate if the CommTel's are quality
products ,like the ones GRE in Japan used to manufacture ? :)

Best Regards,
Knut Otterbeck,
Oslo - Norway

Hey everyone,

Finally, after many server and also other unexpected problems, we have been able to upload the Canadian province and territory frequencies to our web page.

http://www.angelfire.com/sc/scannercenter

We have uploaded frequencies for: BRITISH COLUMBIA, ALBERTA, SASKATCHEWAN, MANITOBA, ONTARIO, QUEBEC, PRINCE EDWARD ISLAND, NEWFOUNDLAND, NEW BRUNSWICK, NOVA SCOTIA, YUKON TERRITORY, and the NORTHWEST TERRITORIES (in other words, EVERY PROVINCE AND TERRITORY).

If you have even more frequencies which we don't have, we'll be more than happy (and grateful) to add them to the appropriate province and/or territory page.

THANKS AGAIN TO EVERYONE WHO SENT US
FREQUENCIES VIA E-MAIL! THIS ADDITION TO OUR
WEB PAGE WOULD NOT HAVE BEEN POSSIBLE WITHOUT
YOUR HELP!!

ENJOY, Scanner Center Administration

I show this as a City of Houston frequency no longer in use.
>453.500 Houston FD - Channel A2 - Fireground and Ambulances
Correct
>453.675 Houston FD - Channel A3 - Fire Prevention, phone patch
Correct
>453.750 Houston FD - Equipment Service
This is Klein VFD channel 2
>453.950 Houston FD - Channel A4 - Investigators and Ambulances
Correct
>460.425 Houston FD/PD - Channel A5 - Citywide Common
This is Channel 5 for HPD only. HFD channel A5 is 460.5750.
>460.575 Houston FD - Channel A8
This is HFD channel 5. Channel A8 is 460.6250.
>460.625 Houston FD - Channel A9 - Fireground
This is HFD channel A8. I am not aware of an A9 channel.
>462.950 Houston FD - Channel A6 - Ambulance Dispatch
Correct
>462.975 Houston FD - Channel A7 - Ambulance
Correct

The only other comments I have about the above frequencies is that the only dedicated ones are A1 - Fire dispatch, A6 - Ambulance dispatch, and A7 - Ambulance to Medical Center. All the other frequencies are used on an as needed basis. I have never heard a phone patch on any of these freqs.

I have the following additional frequencies:
When an ambulance is on a scene and needs to talk to the medical center they will switch to A7 and request a channel. These channels are:
Medical Center to Ambulance Ambulance to Medical Center
463.0000 Channel Alpha 468.0000
463.0250 Channel Bravo 468.0250
463.0500 Channel Charlie 468.0500
463.0750 Channel Delta 468.0750
463.1000 Channel Echo 468.1000
463.1250 Channel Foxtrot 468.1250

463.1500 Channel Gulf 468.1500
463.1750 Channel Hotel 468.1750
You will always be able to hear the Med Center talking to the ambulance but you will only hear the ambulance response if you are near the scene. Naturally the more interesting side of the conversation is from the ambulance to the Med Center.

I have these other three frequencies but they are not confirmed:
153.8900 -- Radio Repair
154.2800 -- This is a mutual aid frequency used by all FD's
461.7125 -- Emergency Management

If you have a Trunk Tracker you can hear Life Flight on the Harris County system Talk group ID 208. (Note to group: I have not heard this in use for some time. Did it change?)

Hope this helps.

Randy Czaplewski

4959. Setting SEARCH on my BC220XLT

You didn't say what kind of computer you have!

The newer computers, ie Pentiums... produce a lot less noise and are shielded
better.

First make sure all of your computers covers are in position and on tight.
Make sure you are using a 3 prong cord, and are connected to a good ground.

Try to identify the source of the noise. Does the noise occur with the printer
and monitor turned off? Try disconnecting your keyboard too.

If all else fails I would suggest putting the scanner antenna as far from the
computer as possible and attach clamp-on ferrite cores to the following:

1. The keyboard cable, IMMEDIATLY behind the keyboard.
2. At BOTH ends of the Printer cable.
3. On the video cable where it exits the Computer.
4. The power cable " " " " "
5. And of course, on the scanner control cable if you have one.

One of my machines is an old 8088 which interfered with everything in sight.
After the above treatment, especially the Keyboard and Printer fixes, about 99%
of my problems dissapeared.

good luck, and let me know how it goes.

H Higgins .

From: Jay Craig <jmcraig1@flash.net>
Message-ID: <6jr58gceu1@excalibur.flash.net>
Source record: 160187

I'm using a BC3000XLT, with the Hamcom interface exactly like the one pictured in the
middle of this page: http://web2.airmail.net/lblant1/dfw/interface.htm (the one by WB5NBQ), except to a 9 pin connector (pins 4,5,7,8 instead of 20, 4, 7, 6); with these settings:

set TRACKSLICERPIN=DSR
set TRACKSLICERPORT=COM1
set TRACKSLICERMODE=INVERT
set TRACKSCAN=NONE
set TRACKSCANPORT=NONE
trunker.exe

And it works fine.

PROBLEM: It doen't work on com2 (25 pin connector), (pins 20,4,7,6 instead of 4,5,7,8). Of course I already tried changing Trunker's settings (CTS, DTR, NORMAL...). Could this be a computer setting I need to change?

.

Please help,

Jay Craig

Need something cheap and small that can take a beating.

Doesn't need to do much fancy -- standard basic frequency
ranges. Should take alkaline batteries and make 'em last.
Hopefully should be something available used.

The frequency range I am interested in is 160-162. (trains)

Suggestions?

How's the Uniden Sportcat look?

thx,
Craig

> Rebuttals? What the hell are you talking about?

I didn't much think you'd like it or even
try to see what I was talking about, so
give it a no-nevermind, and go fix yourself
a porkchop and some mashed taters. Maybe
an ear of corn, if you're really hungry.

> Oh, you don't mind repeating in posts that Wells is biased and two-sided
> but it is reinventing wheels to explain why you keep saying these things.
> Yea, OK. That clears it up.

Good. It's nice that you can see some light.

> > Deal?

> What is this deal stuff?

You know, 5 card stud, one card at a time?

> I asked you to explain statements you made about
> Wellls review and you turn it into rebuttals, deals
> and God only knows what else.

I didn't turn it into anything. The explanations
are already there, along with a trail of threads
that you can read for yourself.

> If you don't want to reinvent wheels then quit making the same
> claims/attacks/rebuttals/statements if you don't care to explain them.

They're already explained. If you can't understand
the explanations, then frame specific questions to
what you can't stomach and I'll see if I can force-
feed you somehow.

> Deal?

Ante up, first.

> BTW, Yes, the Icom is sounding like it may be the better of the two radios.

Then go get one. Or two....

> I don't have a spare ISA slot in either of my machines,

Sounds like a personal problem, actually. I mean,
I can't just shit you one, Glenn. Go find an old
motherboard somewhere and superglue a slot in. I
don't know how to solve that problem for you.

> (am concerned about heat if I could open a slot),

Why? When has heat ever been an issue in a PC?
It's ruminated about a lot.....but there sure aren't
many, if any, substantive issues of heat aside from
cooling the microprocessor, maybe.

> would much rather have the ability to take
> the radio into the field with a laptop.

Yeah, right, with a car battery strapped on
your back and an antenna mast anchored in your
sweet patooty? Ummmmm hummmmm. Ri--ght.

> The WR and its poor HF performance

How do you know it's "poor"? You ever try one.
"Poor" is relative. But if you think it is "poor",
then don't get one. Get an Icom and be happy!
Enjoy traipsing around Tacoma with a 40-lb car
battery strapped to your back and that Icom
glummed to your belt.

> and BFO. In reality I get the feeling both are just so so in the receiver
> specs/performance and maybe I need to wait for the new radios or check out
> Sony.

Right. Whatever turns you on and shickles the tit
outa you. If you like to wait, then wait. If you
like to hurry, then hurry. For all I care, you can
hurry up and wait. Know what I mean?

> It's too bad that nobody has talked much about the
> WR with true SSB or WRe (external 1000 and 1500 I think)

Well, so far those units as well as the WR-3000i
aren't certified for sale in the USA, so there is
little sense in beating our gums about them. You
wouldn't like what I had to say anyway, so I'm
not all that inclined to waste my fingertips just
to give you something else to snivel about.

> and the other new releases hopefully
> coming to the States in the near future.
> Naw, let's flame away!

That's what you're shooting for anyway, so a spade might as well be called a spade. No sense in liver-lipping and mincing words, now is there?

Give it your best shot, eh?

I have came across some type of data that I do NOT recognize.
If I was to send you a "recording" of it... (in wav format) via email...

Would you be willing to listen to it and possibly tell me what it is?

Anyone want to give it a shot? I'm not asking to "decode" it.
Just identify it's "TYPE"... or format rather.

For instance, maybe pocsag?

Jeffrey Miller <jfmil@earthlink.net> wrote:

> Simple answer for you: If you want to take your scanner anywhere like
> on vacation or whatever the ICOM PCR 1000 is the obvious choice.

Obvious? Hardly!

It is only *a* choice, but a handheld or a mobile
scanner is the *obvious* choice. Can you imagine
yourself boogeying about, to and fro, with that
Icom, a heavy battery, a portable speaker or
headphones, a laptop PC, and an antenna?

Yeah, ri--ght.

And then imagine one's dismay if it gets cobbed!

Okay, okay, so you're talking about the automobile
environment and not the tennis-shoe express. Still,
the choice of the PCR-1000 is not obvious. You going
to fiddle with that laptop and radio whilst you're
driving down the boulevard? Again, a handheld or
mobile scanner is the more obvious choice.

Okay, okay, so you're talking about the motel room
environment and not the car-car. Still, the choice
isn't "obvious". You still have to lug the PCR-1000
and all its trappings and paraphernalia, including
laptop, up to the motel room. That means power
supply or battery, too. Hardly an "obvious" choice.

Oh, and guess what? The Icom PCR-1000 is no different
in form and functionality than a radio of some 20 years
ago....the Electra Bearcat CompuScan 2100. It bombed
like a moldy weenie, partly because its portability
was overstated, just like you did of the PCR-1000.

Frankly, and even though there will be exceptions, this
portability of the PCR-1000 is a "blue sky" benefit.
In actual practice, few will ever take advantage of it.
This "could if you wanted to" is hardly a power point.
You won't WANT to take it portable.

The *obvious* portable choice for the computer-controlled scannist is going to be a conventional scanner that can be operated in a conventional manner when the computer isn't connected......clearly, most of the time.

For that matter, it isn't any difficult matter anymore to set up a small desktop computer in a van or motor home and run it off an inexpensive inverter. This level of portability allows WiNRADiO WR-1000i and WR-3000i to boogey down the boulevard, too. Granted, this would be an extreme measure, but it's almost equally extreme to take the PCR-1000 "portable", too.

IMHIO.

BTW....WiNRADiO introduced some models at Dayton that are comparable to the Icom in portability, one that runs off a PCMCIA slot in a laptop, and another that runs off the serial port.

> besides moving the scanner from computer?

First localize/identify the precise source of
the noise. Chances are, it's not the computer
as much as the monitor. Ferrites are known
to suppress emissions from monitors. Shielding
with aluminum foil is known to help. If it
does, you can spray-glue the inside surfaces of
the plastic case and then press the foil into
place.

So a question means you have to force feed answers? The questions were
framed Bill and all you can answer is with this force feed stuff. Count up
about 6 or 7 lines and there is one of the questions you seem to ignore.

> > BTW, Yes, the Icom is sounding like it may be the better of the two radios.

> Then go get one. Or two....

That seems like an odd statement Bill. Are you saying every time YOU see a product that might be better than another you run out and but two of them. Strange advise/behavior to say the least.

Wow, now we got you swearing Bill. No, not a personal problem Bill. You see I was making a statement about my circumstances and why the Icom might fit in better than the WR. People do that in discussions Bill. Why did that throw you into a cursing fit Bill?

> > (am concerned about heat if I could open a slot),
>
> Why? When has heat ever been an issue in a PC?

Aside from? Gee, maybe that is a concern of mine. You don't know what kind of computer I am running and worse yet you don't have a clue as to what cards I have in it. Off the hook again.

> > would much rather have the ability to take
> > the radio into the field with a laptop.
>

> sweet patooty? Ummmmm hummmmm. Ri--ght.

Uh gee Bill, some of us own cars, RV's and the like. Ever heard of camping? The above is such a desperate attempt at making a feature the WR can't do sound insignificant. Guess what Bill? I have operated field day for years with no problem. Camping. Yes, the 50 foot 12 gauge feed off the car battery does work, so do the gel cells in the tent trailer. Also the gel cells in the pack. Try again Bill.

> > The WR and its poor HF performance
>
> How do you know it's "poor"? You ever try one.
> "Poor" is relative. But if you think it is "poor",
> then don't get one. Get an Icom and be happy!

BFO's and strong images on HF is what I have heard. You a seller of WR can only tell me to buy an Icom. Good rebuttal, slick sales technique.

> Enjoy traipsing around Tacoma with a 40-lb car
> battery strapped to your back and that Icom

No I don't. I see you have gone to great lengths to talk about food, assumptions and make cute little phrases like the one above but nothing to address the WR or the Wells review.

> > It's too bad that nobody has talked much about the

>
> Give it your best shot, eh?

No Bill it was sarcasm pure and simple. You have nothing to add to the technical side of the discussion to you just unload on anyone that dares to imply the Icom might be the better radio of the two or even have better features in any area.

Again Bill, where in Wells review is this "pretended bias"? I have read his review twice now and
don't see any major flaw or "pretended bias". You said it and I am asking what you mean by that. You need not include me in your answer. I didn't write the review and I didn't say it was flawed or contained "pretended bias". You did.

>It sounds better hardware wise, and has those cool upgrade cards too. It also looks a hundred times better. I didn't want to get the AOR 8000 because it looked so cheap. I was looking at the Yupi 9000 and Alinco DJ-X10

Aesthetics is important but I wouldn't buy a scanner based on looks alone for any reason. The A8K could be better contructed for the price, that's for sure, but the A8200 looks to be made the same way.In fact, I would choose the A8K over the DJ-X10 any day. It would be a difficult decision choosing between the A8K and Yupi 9K...

I guess the 8200 is not a replacement for the A8K but I wonder if AOR plans to drop the price on the A8K? Some dealers are selling it for about $425--at under $400 it would be a killer.

4984. HamCom decoder, and POCSAG

Newsgroup: rec.radio.scanner
Date: 1998-05-20 00:00:00 UTC
From: ki5xp@mindspring.com
Message-ID: <6k0a35$2i8_002@news1.newscene.com>
Source record: 159957
Cross-posted to: rec.radio.scanner,rec.radio.amateur.digital.misc,rec.radio.amateur.misc

I recently went to the HamComm decoder page and noticed the increase in price. So at Dayton, I purchased the board from FAR Circuits to construct the decoder, completed the project and it seems to work fine in both JV Fax and Hamcom, yet is not recognized at all in either POC32 or POCFLEX. Anyone have any ideas as to what might be the problem? I noticed that the schematics for the board as they are to be constructed ties pin 6 of the 741/941 to pin 6 of the DB-25 which is DSR, yet the diagrams on the POCFLEX page shows that pin 6 of the Op Amp should be tied to pin 5 of the DB-25 pin, which is shown as CTS. I've cut the trace to 6 and jumpered it to 5, yet the board still doesnt work, and although Poc32 allows for both DSR and CTS on the hardware settings, it doesnt recognize the board, nor does it decode data. PocFlex's little "spinny" thing in the top corner doesnt spin, meaning it's not working correctly either, yet HamCom's nifty little spectrum scope clearly shows that it is correctly recieving the mark and spaces, and although it hasnt actually decoded "correct" data, I blame that on lack of knowledge of the program.

I've check all configs on both Poc32 and PocFlex, and neither seem to help, anyone have any ideas?

I admit it right up front so don't get mad.

I have a PRO-64 that I just bought and love it; however, I see everyone talking about all these decoders and digital stuff. I wrote to one guy and he put me up to date on dtmf and ctcss, but how do I know if people in my area are using ctcss? It's subaudible so what should I be listening for that tells me I need a scanner with that capability. I understand the dtmf and trunktracker.

Another question, I'm hearing all kinds of digital stuff as I'm scanning but how do you find out what type of signals they are. I know this is probably pretty general stuff to most of you but I'm lost.

One more for you, I know what SSB is in relation to shortwave, but is this also used in 25mhz and up. I would think it would be, but would like to know for sure.

Thanks for your patience and your time.

After seeing both radios at Dayton, I'd lean towards the Icom.

The question of the external unit has been answered by WinRadio. The 1000i and the 1000e, one internal and the other external.

The sensitivity will be answered soon as well. WinRadio will release the 1500i and the 1500e, for a little steeper price, but better specs.

I found that the Icom software offered more bells and whistles (gotta love em) then did the winradio. Icom's came all bundled, you have to purchase extra the scopes and other stuff for the Winradio.

The price on the 1000's started Friday at $469, and was down by Sunday to $399, as compared to everyone's price (except the booth on the corner in the ballroom) on the Icom around $450-460. One dealer had it at $430, but sold all by Sat morning.

That'd be the 1000e (External) and the 1500i and 1500e. Both looked similar, yet the fellow said basically the 1500 was slightly more expensive and was an improvement on the specs. Dont recall offhand, but the numbers were different.

Charles

BTW: The cases between the Icom and the 1000e/1500e look similar, just finished in different colors. The WinRadio was gray and the Icom was black.

You didn't say where you are getting your audio from, but you must tap
it from the discriminator unless you are reshaping the audio afterward.
There is just too much filtering that takes place to insure that POCSAG
or FLEX will decode accuratly if you take it from the speaker or
headphones. 73s Mike ka3jjz@erols.com

4992. FS: Novex HF converter and Kantronics TNC

Newsgroup: rec.radio.scanner
Date: 1998-05-20 00:00:00 UTC
From: Scott Halligan <halligan@capecod.net>
Message-ID: <3562E0C0.BFECEDB8@capecod.net>

Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave,rec.radio.amateur.swap

I have for sale the following items:

1. Novex FC-7300 HF converter. Allows users of the Yaesu FRG-9600 and Icom R-7000 all mode HF reception. Converts HF and VHF-LO bands to 100-160 MHz range on either of the above radios. Will also work with any scanner (limited to the available modes on the radio). Example: to receive the BBC world service on 5975 KHz, the user tunes his scanner or receiver to 105.9750 MHz, AM mode. The converter is switchable and has N connector jack for VHF antenna passthru. Radio is also fed with N connector jack. SO-239 jack for HF antenna. Unit is in fairly good condition. Has two holes drilled in top of plastic cabinet which facilitated mounting underneath a shelf. Requires 12volt DC supply which is not included. Was $249.00 new approx 5 years ago. Will sell for $100.00. Works great!

2. Kantronics KPC-3 Amateur Packet Radio TNC. Has 128K mailbox. Includes cable to interface with older Icom HT's such as the 2GAT. Also has two holes drilled in top of cabinet. In otherwise excellent condition. Will run on 9 volt battery for portable use. Requires 9-12 volt supply, not included. Will sell for $90.00

Will ship above items COD cash/money order only. If interested, please reply to e-mail address below, do not post reply in newsgroup!

In reference to #1: Yes, but only if they are all racing on your end of
town in Vancouver, Washington. Is there a race there? (I'm not a big racing
fan, but I know their radio equipment fairly well). I carried a Bearcat 210
with a big nicad pack around at Indy in the early 80's and boy did I get weird
stares! -More than 1/2 mile to a mile from a track where a race is going on,

you will begin to lose signals & by a couple of miles away, you won't hear much at all.
Correct me if I'm wrong but the question seemed to imply you want to listen to the track action from your home while watching races on TV? That isn't possible with any scanner.
The easy place to start looking for a scanner is still Radio Shack. Cross reference the frequencies you have against the catalog or pamphlet they have on their scanners & the frequency ranges. Go to the Uniden website (great prices on reconditioned units there, as well as info).
Most scanners for sale now will pick up many of the ferquencies race teams use, but remember they use low powered transmitters and only cover the track area.

>look what happened when the ECPA of 86 was made law - the lines around the
>block were formed by people who WANTED cell-capable scanners, NOT by
>people who wanted to turn them in!!

But the scanners weren't banned, only the listening. There will always be some people who say "screw the government" but 90% of the people will believe that scanner owners are all crooks and that no one "needs" a scanner. They would just as soon turn you in as look at you.

If it comes down to it and scanners are banned under threat of fines or jail and rigid enforcement starts, people will turn them in. In England you're required to have a license for a radio receiver, and people there are so scared of the government that they have about a 90% compliance rate.

> I have reread about 25 of your posts where you
> criticize Wells review and him personally.

Twenty-five? Liken unto two dimes and a nickel?
Where? When?

> I can't find any substance to your claim he is biased in
> his review.

Well, then if you are the judge, I'd guess you
would throw the case out. So throw it out. You
can't find any substance, so there it is. Hard,
cold, brass tacks. End of story. Finis.
You be da judge, Glenn. Case closed. Fine me
twenty five bucks for your time and trouble.

Now go take some Pepto-Bismol and lighten up.
CorrecTol might help a little, too.....

> Where in his review is all this bias?

I have already explained some of it. And others
who contributed to the thread explained a little
more. I'm not...NOT... (what part of NOT can't
you understand) *not* going to go into it again.
Sometimes you seem a little dense.....but...

You have drawn your own conclusions and that's
good enough, Glenn. Good enough for you, and as
for me, I don't give a hoot one way or the other.
I said what I had to say *to* the "Water Walker"

and that's it. Repetition is not necessary, and
if you don't understand or don't see, well, hell,
so what? Could be bad breeding, poor education,
brain damage, or a hundred other outside factors
that neither of us can control.

Just buy a Icom PCR-1000 or two, and go camping,
and be happy.

.....or don't you want to be happy?

Ian Robert Walker <Ian@newbrain.demon.co.uk> wrote:

> >> Poor filtering and lack of proper screening,
> >
> >Poor filtering? Where?
>
> On the supply and control lines, where else would YOU put filtering to
> keep conducted noise away from sensitive circuitry?

Well, reason I asked is because I am looking at
a WiNRADiO as we speak, including some schematics
that I drew up.....and the filtering looks pretty
friggin good to me. So how's about being specific,
so I can address your "concerns".

> >Lack of proper screening?
> >What is "screening" and how do you make it "proper"?

> A conductive box with a contiguous surface that completely surrounds the
> sensitive circuitry.

WiNRADiO WR-1000i certainly has a solid metal box
around the entire receiver. So how can you suggest
it has "improper screening"?

> Where it has to have openings the two sides must
> overlap and use multiple sprung fingering or a conductive gasket.

It certainly has that, too. Are you sure you
weren't looking at a video accelerator or maybe
a Soundblaster card?

> Lines which connect the outside world to the circuit must
> do so via filters mounted in this conductive box. How else
> would YOU keep radiated noise away from sensitive circuitry?

Yes, I understand that. I am an RF engineer of 35+ years.
And I know very intimately about the design and construction
of the WiNRADiO. Your statements and assertions don't make
any sense to me, so I am wondering what's your frame of
reference. Could be someone said "This is a WinRADiO", when

in fact they might have been showiing you a sound card.
Duh? I'm just guessing....but since the WiNRADiO is very
well shielded and filtered, your assertions don't make
a lick of sense so far.

> >> it was a limited view at an exhibition rather than a bench test.
> >> My suspicions were confirmed by a friend who had one for review,
> >> since it was supplied by a retailer wanting a positive report
> >> he declined to provide a review for publication and returned it.

> >I'll be durned. No kidding? Did this cat know
> >not to eat cornflakes with a fork?

> Ah, abuse.

No. I am wondering about the mental faculties of this
fellow who allegedly showed you a WiNRADiO. Because
what you've said so far has no ring of fact to it.

> I thought we were having an intelligent technical discussion.

I thought we were, too. But your statements are not
truthful or factual and can't even be construed to
an "opinion" for that matter. Something is wrong with
this picture. Maybe someone pulled the wool over your
eyes? I dunno.....but this picture has stink all over it.

> For your information we both get paid (different clients)
> for being technically good.

Well, then, let's not only BE good, but let's also be
ACCURATE and TRUTHFUL. So far, none of what you've said
is indicative that you saw a REAL WiNRADiO. Rather than
suggest you're lying, I tried to open the door to the
possibility that you were misled or hoodwinked by
someone else.

All I know is that so far what you've said is mighty
far from the truth. So you tell me: are you lying or
is there a chance you got your leg pulled by someone?

You tell me, so's I don't have to guess.

I didn't say it was. Both are good radios.

> I bought one and sold it within a week. I'm
> an HF man, and the WR absolutely +sucks+ in that area.
> Many other weakness's as well. Sorry. Junk...

Well, you might have had a defective unit, too.
I've seen a couple. It happens. But the fact is
that if you're an "HF Man", you'd have no use
for the PCR-1000 either. No radio, shy of the
Icom R-9000 in the $6000 class is going to be
a model of superiority across its entire spectrum.

No doubt you ran into some kind of an issue,
but sure as tootin, no serious HF'er is going to
tout the Icom PCR-1000 as anything great in that
department, either.

In any case, the WiNRADiO is not "junk", though
if you had a defective, I can see how you would
think so.

SPECIAL EDITION:
ARRL PACIFIC DIVISION UPDATE

August, 1997
SUBJECT: New Proposed Law Concerning Electronic Eavesdropping
(full text)

Wireless Privacy Enhancement Act of 1997 (Introduced in the House)

HR 2369 IH

105th CONGRESS

1st Session

H. R. 2369

To amend the Communications Act of 1934 to strengthen and clarify
prohibitions on electronic eavesdropping, and for other purposes.

IN THE HOUSE OF REPRESENTATIVES

July 31, 1997

Mr. TAUZIN (for himself, Mr. MARKEY, Mr. OXLEY, Mr. GILLMOR, Ms.
ESHOO, and Ms. MCCARTHY of Missouri) introduced the following bill;
which was referred to the Committee on Commerce

A BILL

To amend the Communications Act of 1934 to strengthen and clarify
prohibitions on electronic eavesdropping, and for other purposes.

Be it enacted by the Senate and House of Representatives of the
United
States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the `Wireless Privacy Enhancement Act of
1997'.

SEC. 2. COMMERCE IN ELECTRONIC EAVESDROPPING DEVICES.

(a) PROHIBITION ON MODIFICATION- Section 302(b) of the Communications
Act of 1934 (47 U.S.C. 302(b)) is amended by inserting before the
period at the end thereof the following: ', or to modify any such

device, equipment, or system in any manner that causes such device, equipment, or system to fail to comply with such regulations'.

(b) PROHIBITION ON COMMERCE IN SCANNING RECEIVERS- Section 302(d) of such Act (47 U.S.C. 302(d)) is amended to read as follows:

'(d) The Commission shall prescribe regulations denying equipment authorization (under part 15 of title 47, Code of Federal Regulations,
or any other part of that title) for any scanning receiver that is capable of--

'(1) receiving transmissions in the frequencies allocated to any commercial mobile service (as defined in section 332(d),

'(2) readily being altered to receive transmissions in such frequencies,

'(3) being equipped with decoders that convert digital commercial mobile
service transmissions to analog voice audio, or

'(4) being equipped with devices that otherwise decode encrypted radio
transmissions for the purposes of unauthorized interception.'.

(c) IMPLEMENTING REGULATIONS- Within 90 days after the date of enactment
of this Act, the Federal Communications Commission shall prescribe amendments to its regulations for the purposes of implementing the amendments made by this section. In prescribing such amendments, and in
response to subsequent changes in technology or behavior, the Commission
shall review and revise its definition of the term 'capable of readily
being altered' as necessary to prevent commerce in devices that may be
used unlawfully to intercept or divulge radio communication.

SEC. 3. UNAUTHORIZED INTERCEPTION OR PUBLICATION OF COMMUNICATIONS.

(a) AMENDMENTS- Section 705 of the Communications Act of 1934 (47 U.S.C.
605) is amended--

(1) in the heading of such section, by inserting `interception or' after
'unauthorized';

(2) in the second sentence of subsection (a), by striking 'and divulge'
and inserting 'or divulge';

(3) in subsection (e)(1)--

(A) by striking 'fined not more than $2,000 or'; and

(B) by inserting 'or fined under title 18, United States Code,' after '6
months,'; and

(4) in subsection (e)(3), by striking 'any violation' and inserting 'any
receipt, interception, divulgence, publication, or utilization of any
communication in violation'; and

(5) in subsection (e)(4), by striking 'any other activity prohibited by
subsection (a)' and inserting 'any receipt, interception, divulgence,
publication, or utilization of any communication in violation of
subsection (a)'.

(b) RESPONSIBILITY FOR ENFORCEMENT- Notwithstanding any other
investigative or enforcement activities of any other Federal agency, the
Federal Communications Commission shall investigate alleged violations
of section 705 of the Communications Act of 1934 (47 U.S.C. 605) and
may proceed to initiate action under section 503 of such Act (47 U.S.C.
503) to impose forfeiture penalties with respect to such violation upon
conclusion of the Commission's investigation.

For those of you who may not have the "DC Currents" article in Sept.
1997 QST on pages 15 - 16 concerning HR 1964; here is the
text:

House Bill Riles Scanner Buffs

Many scanner enthusiasts are concerned about a seemingly *technical*
change in a bill recently introduced in the House of Representatives by
Ranking Minority Telecommunications Subcommittee Member Edward Markey
(D-MA-7th). The bill is intended to create added privacy protections
for consumers using the nation*s communications networks.

HR 1964, the *Communications Privacy and Consumer Empowerment Act,*.
instructs the Federal Trade Commission to look into data collection via
computer of consumer information, as well as to examine parental ability
to block alcohol and tobacco promotion targeted to children on the
internet. It requires the Federal Communications Commission to examine
privacy rights and issues regarding use of telephone, cable, satellite

and other technology, including what consumers can do to protect their
own privacy, and what providers should do to protect the privacy of
their subscribers. It requires the FCC to promulgate regulations on
software for parents to block access by their children to objectionable
material on the internet, and it contains a number of provisions on
local exchange interconnects and network data security, including a
preemption clause for domestic restrictions on encryption technology.

But what has some scanner operators riled is language in the bill
expanding the current ban already in the Communications Act against FCC
certification of scanners able to receive cellular frequencies. Under
HR 1964, the ban would include scanners that receive Commercial Mobile
Radio Service (CMRS) frequencies. That could cast a very wide net, and
could even preclude the certification of VHF/UHF amateur gear equipped
with out-of-band scanning capability. Such gear has virtually captured
the Amateur Radio market today, comprising as much as 90 percent of all
new amateur HT and mobile gear, and accounting for half of all Amateur
Radio sales.

The Commercial Mobile Radio Service is a relative new *umbrella*
designation of radio services that act like telephone services [see
sidebar]. Such services are offered on a subscriber basis to *a
substantial portion* of the public and where the service can be
interconnected to regular telephone services. These services are
described in the federal regulations governing radio (Part 47 CFR), and
appear to include commercial paging services, commercial air-to-ground
services, cellular telephone, offshore radiotelephone, personal
communication services and specialized mobile radio services. As a
general rule-of-thumb, it appears that any device that walks like a
telephone and talks like a telephone is likely to be included in the
definition of CMRS, regardless of the operating frequency. The bill
includes *digital transmissions* on those frequencies.

While the avowed purpose of the bill is to ensure the privacy of
telephone conversations, the worst-case outcome of the bill could be
to inhibit, if not completely block the further sale of radio scanners,
since designing a cost/effective device that would selectively filter

all of the proscribed frequencies could prove difficult for manufacturers, and would certainly cut a wide swath through the frequencies scanner enthusiasts enjoy. The impact on scanner use among law enforcement and emergency service users is less clear.

FCC*s certification process is much like type acceptance. It essentially is an authorization for the manufacturer of a transmitter or receiver that emits RF noise to sell such devices in the US. All scanning receivers, including the receiver portions of scanning transceivers, are subject to FCC certification.

Certification of a transmitter or receiver requires the filing of an application with the FCC. The process may include an FCC review of lab tests of the device to determine spurious noise, as well as a review of circuit board diagrams, block diagrams, instruction manuals and labeling. In the case of scanning receivers, the FCC may require proof that the device blocks reception of cellular frequencies, and sometimes requires that a sample of the scanner be submitted as part of the review. Scanners that receive any of the frequencies that might be used by the Commercial Mobile Radio Services would no longer qualify for certification.

And that is why Amateur Radio operators may also want to sit up and take notice. One of the bill*s (perhaps) unanticipated side effects could be to include scanning receivers in the certification ban, and that would cut a broad swath through current VHF and UHF scanning transceivers that scan out of band in order to receive law enforcement and public service frequencies. The ability for amateurs to monitor these frequencies can be critical in emergency situations where amateur volunteers must coordinate their efforts with local emergency or law enforcement personnel.

As a result of this possibility, ARRL is meeting with Congressman Markey*s staff to seek clarification and to discuss ways to amend the bill before it moves much further through the legislative mill. But this legislation may have deeper (and more politically sensitive) roots than a mere desire for consumer privacy. Early in the 105th

Congress,
Speaker of the House Gingrich was publicly embarrassed by the
disclosure
of the purported contents of a cellular conversation he had regarding
strategy in his ethics case. Since virtually every member of
Congress
uses a cellular telephone, the issue was watched with great interest
and
no little discomfort. As a result of public attention to the issue,
the
House Telecommunications Subcommittee conducted a fairly emotional
hearing on the issue of cellular privacy. The witness list pitted
Bob
Grove, one of the best-known scanner distributors in the US, against
Tom
Wheeler, President of the Personal Communications Industry
Association,
whose association is leading the industry fight against scanner
eavesdroppers. The hearing was extremely contentious and prompted
speculation that more restrictive legislation might be forthcoming.

At least based on the general tenor of that hearing, which ARRL
attended, it would appear that commercial interests who supply
Commercial Mobile Radio Services may be a driving force behind the
legislation. It also appears that the Association of Public Safety
Communications Officers (APCO), has chosen to sit this one out on the
sidelines since membership opinion is divided on the issue of
scanners.
Even so, one of the primary issues affecting whether this bill will
go
anywhere could turn out to be the effect it would have on scanner use
by
-- in addition to amateurs -- law enforcement, fire departments,
emergency services, newsgathering organizations and other
non-recreational users.

Interestingly, the legality of amateur equipment with out-of-band
capability was the subject of an FCC Memorandum of Opinion and Order
as
recently as September of 1993 (PR Docket No. 91-36) ruling in favor
of
an ARRL motion seeking FCC preemption of local ordinances affecting
such
transceivers. In the Memorandum of Opinion, the FCC ruled that
*state
and local laws must not restrict the possession of amateur
transceivers
simply because they are capable of reception of public safety,
special
emergency or other radio service frequencies...* This ruling could be
overturned by HR 1964 in its current form.

There are, of course, broader issues to be considered, such as how much
of the security burden the service provider should bear through
encryption or other techniques, as well as the effect of existing *don*t
divulge* provisions of the Communications Act. While the prognosis on
this legislation is still unclear, ARRL believes that Amateur Radio
emergency operations could be significantly affected should the bill
move forward with its current language, and will continue to provide
information to Congress. Our overall strategy will depend upon what
kind of progress the bill makes over the next few months.

Hi, I'd like to hear from anyone that can tell me as to how to program the Search function in an old AOR AR2002 scanner. I need to know how to set upper/lower freq limits and set freq step increments. The unit I have is missing its front pannel overlay, although I have figured out the basic keypad functions for Mem CH programming. Also if anyone is familar with the external computer interface for the '2002, Id like to get some info on any PC software/hardware that might still(?) be available as well. I am already aware that the interface on the radio is NOT a standard RS232 type. Thanks Steve DE WA1YKL

> >Way to go... But, why so big? A few years ago, we put an MX-014 based
decoder inside a BC760. Yes the MX-128 uses a common 3.58 MHZ color
burst crystal, but limits you audio thats inverted against a 3,330 Hz
pilot tone. With the MX-014, that uses a 4.00 MHz crystal for the 3,330
Hz stuff and you can also easily use (I think its) a 4.194 MHz crystal
for audio inverted against a 3,500 Hz tone, which is used in some newer
cordless phones,,,,,. Steve

Have you tried the sound card input? It works fine for me for transmissions up to 2400 baud, but I'm not using the COM port. I don't even think it supports FLEX and 9600 yet eventhough the buttons are there, so there wouldn't seem to be much advantage in using the COM port at this point.

>> Ya, go for the Sportcat. Its durable, reliable, and very easy to use.

>FYI the DC jack on my Sportcat stopped working about a year after I
>purchased the radio.

I had the same problem with mine recently (thanks to all who replied with help). Turned out to be a broken solder connection. I took the jack off and reattached it and haven't had any problems since.

I use mine mainly for trains also and I love it. I can pick up for about a 10 mile radius (mountains of Southwest VA) with the "rubber duck" supplied. I get a larger radius with my RS and homemade antennas. I also listen to police and emergency departments and can get a 50+ mile radius for these. The battery pack will last almost a full day on an overnight charge. You can also pick up a spare battery pack and a DC power cord for your car at RS.

As I said I love mine. Had it 4 years, dropped it a few times and it even fell from the sun visor of my truck, but still works as good as the day I bought it. Definitely a good buy for under $200 (found mine for $150 new and have seen used ones under $100).

Good Luck,
Jamie

5011. PRO-2042-closeout

The pro-2042 base with 1000 channels is a closeout item at
radio shack. They couldn`t find any in my area, but found 15
in the va. beach area. I had one shipped in from there. This
was a week ago. It has good coverage including military. A.M.,
F.M., Hyperscan for $299.00. This is probably the last military
coverage scanner left at radio shack. (Don`t quote me on this).
Radio Shack is cutting back on frequency coverage. First it was
cellular, now its military. What happened to our rights?

You might try tuning the scanner to 488.4625 or 488.6625. These are
images of that frequency.

This works on all dual conversion scanners, which the 230 is. All you do
is take your desired frequency (470.0625) and add 2 times the scanners'
IF (10.7 or 10.8 x 2). The owners manual will tell you which one to use.

I use this trick on my dual conversion scanners to reduce pager noises
and other garbage they pick up.

Yeah, the 895 is a good scanner (I love mine) but it would look silly attached to your belt at an air show.... ;-)

My advice: If money is no object, get one of the AOR handhelds. Huge range, no gaps (if you know where to shop..), and computer interface as described above. The downside to them is they are rather complicated to operate if you're new to scanning.

Otherwise, watch for someone selling an old PRO-43. Not as good as the AOR, but easily 1/3rd the price. (No PC interface either, if that matters to you.)

Source record: 160029

I was wondering if anyone has built the 4 level FSK decoder for POCFLEX. POCFLEX is a FLEX and POCSAG decoder. I have tested it with the 2 level decoder, (Hamcomm) and the flex works well. You can only get two of the 4 data streams. I was tempted to build the 4 level to decode all.

Was wondering if someone had built the 4 level and could tell me how it works.

The URL for the Flex decoder software is below, The software is freeware BTW.

http://www.geocities.com/CapeCanaveral/Launchpad/4039/

>
Probably depends a lot on the design and quality of the scanners. My
garage scanners, a Bearcat 210 and a 210XL need to be kept at least 3
feet apart. Otherwise, when the 210 locks on an air band image (which it
is prone to do) it locks the 210XL right along with it. At 3 feet or
more apart the 210XL continues to scan. In the house I can stack my
PRO-2006's on top of each other without any problems.

That price is pretty much equivalent to purchasing a used 2035 or 2006
($300) and adding the OS-456/535 board ($200). Personally I'd go that route
so that I could use the scanner without a computer, if necessary.

If the black box were priced at $300, it would be a different story.

I don't have the scanner anymore so I can't check. If the pinhole
reset button on your Pro-50 works like the same thing on the Pro-2006,
try this (from another post):

To reset your scanner switch it on then:

1: press and hold "Clear".

2: using a pointed object, press and release the
"Reset" switch. (Use a paper clip)

3: after confirming the display goes blank,
release "Clear".

Memories will be erased as well.

Both! The three city police forces were forced into a mandated merging
by the Province of Ontario in 1994-95? The new Ottawa-Carleton Regional
Police Service is using an 800 Mhz EDAC trunked radio system. So all
the VHF freqs are no longer in use.

Try the web site for nascar freqs:
http://www.speedworld.net/frequencies/frequencies_index.html

I remember another site, I can't remember exactly though, I
think it was westex, or something like that. There were lots of links to
other groups.

I work some of the nascar and cart races and they for control, still use
uhf freqs. Most of the cars are using uhf but some of them are now 800
mhz. A few of them are scrambled. Many teams, like race control, use
small repeaters, to reach around the tracks. I would look for a scanner
that includes 800 MHz. I own several. I like the Uniden Trunktracker. It
holds 300 channels, does 800 MHz also. If your local public service is on
trunking, you can probably pick them up also. Hope this helps.

What type of design do the Scantenna and the Radio Shack use? I'm would
like to build an an onidirectional, outdoor scanner antenna for much less than
the store bought antennas. Is the Scantenna made from different length
dipoles using the same feed point, or are there also transformers used in it?

The Comtel 216 is smaller than the BC 3000XLT and has no gap in the UHF TV band, according to the Javiation web page. Both units are made by Uniden.

I HIGHLY recommend Rayovac Renewals (rechargeable akalines). My scanner (PRO-64) should normally get 18.5 hours for an average use. With these, I get about 22 hours.

They also have no memory effect - they in fact say they should be recharged as often as possible. You can recharge them up to about 100 times or more.

MikeDR1 wrote:

I will never use that battery pack again. It went out after about 2 months, and they are still NiCds. Like I told MikeDR1, he should use Rayovac Renewal rechargeable alkalines, which are much better and have a much longer life than NiCd.

Well, the chap had a German accent, the stand had WinRadio poster on it,
the card was printed WinRadio, it had antenna & AF connectors on the
end, the chap said it was a WinRadio card, the stand cost the exhibitor
a lot of money. I do not see why someone should go to so much trouble to
show me a "sound card".

If so, then it was by the producers of WinRadio showing an incomplete
prototype. It had no screen, and before you suggest it was removed for
show there was no where to mount it.

Source record: 160049

Cliff:

Ch1 through 4 are having xome maintetance done on them for several weeks. Team operations previously on Ch1 through 4 are now on the NEW Ch 7-10, in their respective order. Note: This is the NEW programming, which can be found in the Southwest Frequency Directory's new 4th Edition. Take a look at:

http://www.azstarnet.com/~danr

Please consider ordering a copy of the local scanner reference, Southwest Frequency Directory. In the mean time, here's a quick list of the channels you need:

Ch7 154.115
Ch8 154.815
Ch9 154.875
Ch10 155.805

Again, these are new frequencies, and now all use repeaters. Many other changes have taken place with regard to TPD's radio system, and these as well as updated radio codes, terms, unit designator descriptions, SWAT lingo, and more can be found in the SWFD 4th Edition.

What do you mean "Battery Pack?" I am talking about the "High Capacity AA Batteries." Not the cheap purple or silver ones, but the gold colored ones (no, not the NiMH either). Those are the ones that Consumer Reports said were the best a few years ago. By the way the will last just as long as a Rayovac Renewal (which states on the box that it can be charged up to 25 times). NiCds can be charged over 500 times! I can also charge them up in my scanner. There is no need for a special charger like for the renewals. Another warning about renewal batteries. You shouldn't use them in high drain devices such as remote control cars. They get hot and die even faster!

People keep saying things like this, but yet they just roll over and let the government take more and more of our rights away. If the government announced tonight that scanners would be banned in 30 days, there would be lines around the block to turn them in. People are really "sheeple" and believe whatever the government says. All the government has to do is label someone "extremist" or something "dangerous" and the sheeple will rally around to oppose them. It happens all the time.

>me virtually EVERY time I let someone borrow something?

This sounds EXACTLY like what happened to a Pro-43 I had at work. It
was loaned out working and returned in the condition you documented.
I was ready to take it back to Radio Shack (who had already quoted a
flat $100 on the repair) when someone suggest a RESET procedure that
was not documented in the manual.

It worked! The scanner was restored to full functionality. I don't
recall whathat Pro-43 procedure was (something like press 2, 4, & 9

keys while turning the scanner on) and I don't know if there is a Pro-50 reset procedure like that, but it would be worth asking about or researching!

Steve

To quote Homer Simpson: "WOOOOOO HOOOOOOOOOOOOOOO!!!!!"

I can't believe it! Here I was all ready to send this thing back
to Radio Shack repair (and lose cellular coverage) when all I
had to do was hold down a couple of buttons and turn it on!

I love you, man! And I don't even want your beer!!

Hook it up to a scanner that does not go above 512 and then turn it
on and scann the 400 - 512 mhz range and you will get the 800-900
range not usre what the exact range is but you get the general idea

> your submarine, Mr. Cheek?

Excuse me?

The new WiNRADiO units were just announced at Dayton.
I had nothing to do with their development and no
advance knowledge of their entry. News of them came
after the fact.....but it still serves to jerk the
rug out from under those who rested their case on
the portability of the Icom.

So 'scuse me if I don't know what horse you rode
in on. Facts are facts..... and certain people
tried to take leverage on a "fact" that just happens
now to rebound on 'em.

Never mind the FACTs that neither the Icom nor
the WiNRADiO's are really "portable". It's just that
if people want to argue that the Icom is portable,
then they'll now have to grovel because so are the
new WiNRADiO's....at least to the same extent.

Just the facts, pal.

On the supply and control lines, where else would YOU put filtering to
keep conducted noise away from sensitive circuitry?

>Lack of proper screening?
>What is "screening" and how do you make it "proper"?

A conductive box with a contiguous surface that completely surrounds the
sensitive circuitry. Where it has to have openings the two sides must
overlap and use multiple sprung fingering or a conductive gasket. Lines
which connect the outside world to the circuit must do so via filters
mounted in this conductive box. How else would YOU keep radiated noise
away from sensitive circuitry?

> I don't care who's the bigger jerk. We are
> all a bunch of jerks <G>

Speak fer yourself. <g>

> Has anyone written some cool apps with it ?

"Doctor Demento" has. Get two files off my FTP site:

ftp://204.210.11.204/winradio/

perl95nt.zip
wrcnvprl.zip

Instructions are contained in the files. They
are Perl scripts designed to read from and write
to WiNRADiO's data files. Makes it easy to export
data to and from them. Like from a CD-ROM, etc.

> Also, has anyone heard of a morse code decoder that
> uses a sound blaster ?? It must be possible using
> the DSP onboard.

The WiNRADiO WR-1000i doesn't have DSP. But still,
a discriminator tap on the NFM discriminator will
yield the line level output that can drive the
Date Decoder or Data Slicer, from which several
different software packages will decode the Morse.
HamComm is one, but there are more.

The Discriminator data for WR-1000i are:

NFM Chip Ckt Sym Pin Alternate
======== ======= === =========
MC-3372D U2 9 TP20

I suggest you follow the general steps of procedure
outlined in my regular (and recent) post titled
SCANNER DISCRIMINATOR DATA with the only variation
being where and how you install the connections
and jack on the WR board. There is plenty of
room on the backplane strip to install the jack.
I'd use an RCA jack, if I were you. Makes for
better and more solid connections.

The Data Decoder circuit in my recent post will
work fine. Just follow the instructions.

I have owned a Winradio 1000i for about 3 months now, I have had problems with noise, but it turned out to be a mother board problem(where dunno). I never bothered to troubleshoot, beyond checking grounds and power supply, seeing that 486 mother boards are not expensive (plus I had a one in my junkbox). I have found it to be much fun for a gadget lover like myself. The software makes scanning easier, finding signals that is. I have also tried the Icom pcr-1000 at my local ham shop and it is also interesting.

I can not compare the two, simply because I haven't used the Icom as much as the Winradio. The winradio has been a good performer for me. I may pick up a used pcr-1000 when they start appearing in the newsgroups, but until then.....

> sorry Bill your my hero,but why argue with all the idiots.......

Easy.

It's hard to tell who's an idiot until
you've argued with 'em for a spell. I feel
everyone deserves a chance, but you can't
tell those made out of flesh and blood from
those made out of horse droppings until you've
sparred with 'em a little.

Hugging and kissing don't get it, either.
Everyone's got a "nice act", and if they've
been around for any period of time, you just
can't tell about it because they've learned
how to polish it to a bright shine. Take
our illustrious "Water Walker", ferinstance....
That doode has got himself one slick act.

But after a spell, I can tell who's worth it
and who ain't. Those who ain't go on my
Twit List (killfile) and I don't mess with
'em anymore. They know who they are......

But the screaming heebie-jeebies is that
there's new ones pop up all the time. So
the cycle just repeats itself every couple
of months. That.....and some of the old
ones go under cover and come up with new
identities and new acts so's you have to
start all over with them, too.

Thusly, there is just one modus operandi
for these newsgroups that works real good.
And that's where you read what you want and
don't read what you don't want. And have
a good newsreader/editor that has a killfile.

The more unmerciful you can make it, the better.

Mine's downright vicious, I'll tell ya what!
It can filter out fly specks from sugar
and separate honey from vinegar. And believe
me, I've seen some awful thick vinegar flowing
around here at times.

You have to be philosophical about it and
not give too much of a hoot. After all, this
is virtuality at its finest. But some folks
are so hung up on it that they think it's
reality. More's the pity.....tsk...tsk.

> I am looking for the Police codes used by the Toledo, OH Police...

TOLEDO POLICE INFO

The Toledo Police Department uses a 20 channel trunked system for most of its communications. Check on the internet for updated talkground information.

TPD dispatches most of its calls in plain English. Only a few 10-codes are used, noted below. Also note the letter codes, which you will hear after an officer is complete after a code. They designate what action was taken by the officer.

10-Codes
18 - Dead person
23 - Arrived at scene
42 - Request to be placed off duty at end of shift

Disposition codes
A - Arrest made/Suspect in custody
B - Report taken, no arrest or citation
C - Citation issued, no arrest
D - Verbal warning given, no arrest or citation
E - Assistance given (no crime)
F - No action necessary
G - Unable to locate caller/house/complainant
H - Complainant/Suspects left scene before officers arrival
I - "Code I" Call canceled while officer enroute

Unit Assignments
You will hear unit designations such as 150 or 230. The first number refers to the district in which the unit is operating. The second number refers to the "beat" within that district and the last number is the type of unit (Mounted, motorcycle, bicycle, patrol, sergeant, etc.)

- All patrol units end in "0"
- All sergeants end in "5"
- 212 - Detective Bureau
- 281 - Records Section

Common Terms
LCJ - Lucas County Jail
Crew - police unit
Call the box - Call the dispatcher / records office
Attatchment(s) - When listening to the records section, this refers to a warrant
Check for WW - Check for wants and warrants
"Unit XXX would like to be on the list." - Unit XXX wants on the waiting

list for the records section

5068. Can you or I hear NASCAR/CART?

Newsgroup: rec.radio.scanner
Date: 1998-05-20 00:00:00 UTC
From: Tony Gaylord <tgaylor2@ix.netcom.com>
Message-ID: <356290EF.23D15DF7@ix.netcom.com>
Source record: 160091

Good Evening,

Let me start off by saying that I use to listen to a scanner I bought at the old Radio shack years ago and enjoyed it. I am now lost in what I'm wanting and was wondering if you could help me out.

I am a huge CART (Champ cars) and NASCAR fan and have read numerous times from people on Cart/Nascar web sites and newsgroups about scanner frequencies and so forth. I am really wanting to be able to listen to in car communications to their pit managers and was wondering if this is even possible? As you know, there are a ton of frequencies on these newgroups that are being updated on a daily basis but here are my 2 big questions.

1. Can I buy a scanner and an antenna and listen to my favorite CART/NASCAR drivers from Vancouver, Washington?

2. If so, then where can I go to find a scanner and an antenna to be able to hear them?

Also, can you let me know what a scanner and an antenna might cost these days? What scanners can I buy that are capable of picking up these frequencies that I'm wanting to hear?

If you can email me and let me know, I would greatly appreciate it.

Thanks for you help and looking forward to your response!
Tony Gaylord - Vancouver,Washington (USA ;)

While software is nice to decode with, (free) you can build a decoder with an MX-128 chip into a pack of cigarettes. There is no computer to lug around.

The main problem with this is you will be followed by the ATF for purchasing cigarettes. Given of course that you have the $20 per pack they will soon cost.

This statement has already been disproved. True, there are sheeple out
there who accept anything and everything the government sez as gosple. But
look what happened when the ECPA of 86 was made law - the lines around the
block were formed by people who WANTED cell-capable scanners, NOT by
people who wanted to turn them in!!

Some assembly required.
Batteries not included.
Void where prohibited.

The following assumes that you are using an external antenna mounted distant from the computer.

Grounding the chassis of the radio and computer to a common ground should cut any AC hum considerably and also reduce RF interference somewhat. Do not daisy chain the ground lines. Run separate ground wires from each device to a common ground point - 10 foot ground rod, copper water pipes or what have you.

RF ferrite chokes on the scanner, computer and monitor power cords may be needed. Before spending a fortune on chokes, you may want to try running your scanner from a battery to help decide which AC lines if any may be contributing to the problem.

If the interference is RF induced directly into your scanner through its plastic case, a conductive spray paint job inside the scanner AND/OR computer AND/OR monitor cases might help. Wrapping the scanner in tin foil and grounding it to the scanner chassis will simulate this approach.

Running power cords, serial and parallel cables in nicely packaged bundles could contribute to RF cross-talk problems. I find that a sloppy mess of wires seems to cause me less noise.

I've run a Kilo-Watt of RF here without interference to or from the computer or transceiver using the above approaches.

Cheers,
Paul

Try the Uniden BC895XLT TrunkTracker. You can get one at a good price from http://www.usascan.com. Even if you don't use it for trunking at all, it's still a good value. It has good sensitivity in the 225-400 band, and also has a computer interface.

Avoid the Uniden BC890XLT... The sensitivity is poor from 225-512, and from 250 to 400 it has a lot of "mild" birdies.

>Does anyone know how to get rid of computer interference on my scanner?

I know that running out to buy a new computer isn't a trivial thing to do, but you might consider getting your hands on a used laptop. My Toshiba Pentium laptop generates far less RFI than any desktop computer I've ever owned. That includes my neighbor's desktop PC. I can tell when he's using it because I get all the interference... 100 feet away!

I have a properly grounded roof antenna, with good coax, situated about 40 feet from the computer.

Ryan,

I see your posts on HamNet on CIS, too. Seems you're pretty active.

Anyway, I saw you mention the following:

• Rayovac Renewals (rechargeable akalines)

and was curious because I'm about to purchase some rechargeables for my Uniden BP-205 battery pack for my scanner. This battery pack has a small charging circuit (with a overcharge limiting circuit) for charging the Sanyo six AA ni-cad battery shrink-wrapped package that has a total output of 7.2v and 600mA with two rows of three batteries each all soldered together in series with solder-top batteries. I had been thinking about upgrading to nickel hydrides but saw your post and was curious if I could rebuild this battery package to include the rechargeable alkalines?

Would you have any knowledge about the output of these Rayovacs as to voltage and millamperes AND whether or not the charging circuit in my BP-205 battery pack could correctly charge the Rayovacs?

Thanks.

Charles

I take my SC150 with me almost everywhere and have bought a few ear buds, one from RS and a Memorex from Wally World. They all lack, well, umm...they're crap, it's that simple. They sound like someone trapped a bee in a coke can. I like to put in the ear bud when I'm on my motorcycle or in my veh with the windows down, I need fidelity. Can someone please tell me where I can get a really good ear bud? Thanx

Don't even THINK of it.
A nicad charging circuit cannot safely recharge Renewals.

Most chargers for RAM cells use constant-voltage pulsed DC, with per-cell
voltage monitoring in between pulses. The duty cycle is tapered as the
cells reach 1.65 V. This algorithm is usually implemented using a custom
charging IC like the one that Motorola's ASIC division developed for
Rayovac.

I searched for the bill that actually passed, but I couldn't find it.
I have deleted my posting, and now direct people to the sites that you
cite. My main reason for making the posting was to slap people, to show
them by not paying attention to their elected officials the law was in
Congress. The original Taurzen Bill would have BANNED SCANNERS! If it
wasn't for lobbying from organizations like ARRL, ACLU et al...

Wake up people, how come a foreigner like me (Canadian) has heard
of Bill H.R.2369, but USA Citizens for the most part only heard of
it after-the-fact. It has been covered by Popular Communications and
Monitoring Times.

Radio Shack HTX-202 2 Meter Amateur VHF*FM Transceiver
$160 obo

This is in the original box with everything that originally came with it: antenna, charger, ni-cad batt. pack, alkaline batt. case, and manual

Bought brand new at the $199.99 price a few months ago. Only fiddled with it a couple times to see how it operates. Have studied for most of the test, but too busy with work to have much time to finish and get the license.

This radio is extremely close to brand new. No physical blemishes whatsoever. Please email if interested. May also consider trades.

Randy

I saw Can Scan the 1991 book was a complete copy of the various Haruteq
Books. In fact Bart Veerman (Haruteq) listed a few control frequencies
that only appeared in his book. Example; Ottawa listing 165.2700 was
listed as Sherwood Studio, this freq was used by them, but it was a
low power simplex freq, and was never used. Their main frequency was
listed as 163.7400 but this was a RCC used by several companies. I
know, as I worked for Sherwood Studio and sent the 163.7400 and the
165.2700 (simplex) Freqs, to Haruteq. We seldom used the simplex
channel as we found it next to useless for any of our needs. The
author of Can Scan seemed to compiled Haruteq's entire listing into
their book, complete with the "control" (trick listings). You can't
copyright a list of numbers, but you can put a few unlisted and unknown
freqs that nobody can actually find.

Look for a mono "walkman" style headset. These are less noticable than
a single in ear unit. I do have a real good Motorola in ear unit, that
I bought for a Motorola HT-210 I used to use, but you end up looking
like a Secret Service agent with it. The "walkman" style blends in
because everyone and his brother have walkmans... These headsets maybe
illegal under your Highway Traffic Act. My roommate bought a in ear
stereo walkman earbud system, abd cut off one earpiece.

5107. Anybody know the Radio Shack PRO-67 scanner?

Newsgroup: rec.radio.scanner
Date: 1998-05-21 00:00:00 UTC
From: baf@texas.net
Message-ID: <QH_81.3802$wM5.4367902@news.giganews.com>
Source record: 159924

I am looking for a scanner mainly for the railroad frequencies (160-161 MHz); other features, such as trunking, do not matter much. Local Radio Shacks have a 300 channel PRO-67 for about $130, which seems like quite a deal. Are there any strong negatives associated with that scanner? (I would replace the antenna with one tuned to 160 MHz.)

Thanks for any comments.

BAF

Does anyone know what company's technology is being used for the new trunked system for Will County, Illinois? It's not Motorola Type I or II... The BC895XLT doesn't grab the control channel.

The system isn't being used yet because the squad cars are still using the 39 MHz frequencies. I'll have to dig up the exact frequencies. I'm at work and don't have the scanner with me!

Source record: 159930

I was wondering that my TV station in my area that I enjoyed watching, I kept fixing the antenna for that station and its picture did not clear up. The TV Indoor Antenna does not improve this station. But, I am getting ready to build my own outdoor antenna without buying it. Once I made it myself, I can get this station more clearly then the rest of the TV stations I watched. But for my favorite radio station, I couldn't hear it too good even it is broadcasting in my area. Plus, my favorite NYC station, I couldn't get that in Pennsylvania. Can an outdoor antenna work for all of these?

1. What do you need in order to make your own outdoor antenna?
2. What are the advantages of an outdoor antenna?
3. What stations should you pick up(Ex. NYC from Pennsylvania)

E-mail me at cgcom1@juno.com

CM> suggestions as to which antenna would be good for an external fender
CM> mount on the car.

Antenna Specialists sells an "undercover" antenna for police.

I've seen departments around this area use a regular AM/FM
antenna, extended and soldered/welded at the proper length.

You may also want to check out Price Costco, they sell an Panasonic High capacity 1100 mAh AA set of 4 NiCads with a nice voltage inflection charger for around $14 dollars. They should last much longer than the standard 600 mAh cells. They are a nice compliment to the rechargeable alkaline which have a much shorter life, this way you can rotate the various packs.

The Panasonic charger runs on a simple timer; that's why the instructions
tell you to take the low-capacity batteries out after 3 hours.

Source record: 159939

Is there yet a handheld that combines Trunk Tracking, frequency up/download and computer scanning control? I like the BC235/Pro-90 but I didnt see anything on whether they had frequency management and computer control. The Icom R-10 is great but lacks Trunk Tracking...is there a handheld with all these features yet.

I found the Icom to be a great unit and more portable as an external unit. As a scanner it is not the greatest, on HF though I found it to be very good. Some people complain about selectivity problems but I haven't seen that. The software is good for HF listening, but again as a scanner the software lacks. I suspect Icom will have to open up more of the command set in the coming months to stay competitive with WinRadio, besides most of the command set is now on the net. The original WinRadio card had pretty wide filters compared to PCR-1000, I think the narrowest filter was 6k as opposed to the 2.8k on the PCR-1000. If your interested in HF more than scanning I would go with an Icom.

Squeeze the Weeze,

• 1400mAh pak that replaces a BP-8

My Uniden BP-205 has a 7.2v 600mAh six AA nicad shrink wrap battery pack in it. My question is concerning the charging circuit and whether it will correctly charge anything higher in capacity. After talking to 1-800-Batteries, it is my understanding that there is a considerable difference in the way these different types of batteries charge, i.e. nicad, nickel metal hydrides, alkaline, etc. Therefore, one cannot change to different types from the originals without modifying your charging habits.

Furthermore, shouldn't one stay in the general stock output range of the original batteries to avoid putting too much amperage to the radio?

Thanks.

Charles

Well, if you listen to the crowd, you'll find
a variety of opinions that do not congeal into
a predominant consensus. You will find lots of
emotion; a few facts; and lots of product loyalty.

Even the few facts may not constructively
contribute to your decision.

Personally, I think you should visit both Web
Sites, Icom's and WiNRADiO's:

http://www.winradio.com/home/news.htm

and

http://www.icomamerica.com/

Send each company an e-mail and evaluate the
responses, based on who responds first *and*
with the kinds and quality of details tailored
to your question(s).

info@winradio.net.au

and

??? I can't find an e-mail address for Icom.
Their web site lists phone numbers and addresses
for more information.

Ask specific questions here, too. You ask for
someone's opinion, and that's what you get. But
given product loyalties and the emotion, would
you want to base a decision on that alone?

I think a lot boils down to the exact features
and specifications you want in a radio, not to
mention price....so you have some homework to do,
but the above may help a little.

5129. Trade BC 235XLT for 3000XLT (??)

Newsgroup: rec.radio.scanner
Date: 1998-05-21 00:00:00 UTC
From: MacUser@Penn.com
Message-ID: <MacUser-ya023580002105981944300001@news2.penn.com>
Source record: 159946
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi folks:

I recently purchased a Bearcat BC235XLT, the 300-channel trunk tracker handheld. It works great, but I don't really use the trunk tracker feature as much as I thought I might.

When I was shopping, I was also looking at the BC300XLT as an option. I'm curious if anybody out there has a 3000 or another high-end handheld they would want to trade for the 235.

The big advantage to the 235 is the trunk tracker feature. Unfortunately, there's only one trunked system in my region and I only find myself in that broadcast region on the average once a week for a couple hours. Hardly worth having trunk tracking for that.

Drop me a note if you have something you might want to swap. The 235 is in excellent shape, like new.

- Dave

Date: 1998-05-21 00:00:00 UTC
From: Andy Ulrich <ulrich@null.net>
Message-ID: <6k2gvp$3u7@bgtnsc03.worldnet.att.net>
Source record: 159952

Whoa, there! There's some confusion going on here!

RS DOES in fact sell a base station TrunkTracker scanner, the PRO-2050. I don't know it it's on sale or not, offhand.

BUT: the PRO-2050, although it's in base station form, is no BC895XLT. It's actually almost identical to the PRO-90 handheld scanner, except you plug in external power, and there's a subtle display difference ... and that's just about it.

So yeah, there is a base station scanner at RS, but know that if you buy it you're compromising. Of course, if it's cheaper than an 895, maybe it's worth it to someone.

I'm looking for a frequency for the Alcohol and Gaming Division of DPS in Albuquerque NM. If anyone know where I might be able to locate it I would appreciate it.

Thanks

Yes scanners will interfere with one another but mostly on the image
freq's ie 10.7 mhz down,any receiver sends out a signal from where
they are receiving,this freq also is doubled to 21.4 and the signal
can be heard 10.7 mhz above too!,Some scanners ie Bearcats use a 10.4
if and this is a identical situation..so allllll kinds of small
harmonics can be sent out,even in the expensive units,if u tune 10 .7
or 10.4 lower than the other scanner,u can bet ur last dollar that
u'll hear the signal...try putting it on search scan and include the
10.7 freq in the middle of the range,its neat when if u open the sq on
the other scanner,that you can hear it homing in,the sound gets deeper
and when it has tracked down the exact freq,it locks up..enjoy...

>ENJOY, Scanner Center Administration

I know you mean well,but hey....if all you have to offer from the NS
area is just a little bit of this and a little bit of that,then why
not just quit it while ur ahead..plus you cannot copywrite open public
material even if you have been given it from someone else,this thought
is stupid...If you wanna go out and spend a lot of gas and investigate
frreqs right across Canada and so on,then maybe a copywrite would be
logical,but you also have to apply to the Gov to get a copywrite on a
certain work..now to myself...the way I keep my copywrite is not to
give out freqs that I find out and put a effort into finding out whos
on the freq,I made a error in the mid 80's of letting certain lots of
freqs out to a local guy and he ended up forwarding it into a local
database that ironically when I see radio shack local books etc,the
info line that follows some freqs is the same as what I named it as.So
where is all my payback for doing all the work while some guys on the
web and locally try to sell my work along with other work..huh!Oh
well,what I find out from now on,will remain secret ...
regards....

That just isn't true. The RF Spectrum Scope comes with
the WiNRADiO software.....downloadable for free. The
Digital Suite for WiNRADiO costs extra, but you weren't
talking about that one.

Then you did not see a REAL WiNRADiO. I don't know
what you saw, but the real McCoy comes with a very
stout all-metal compartment that mounts on the 3/4
form factor AT card. And the I/O lines are all
exceptionally filtered.

Check with anyone who's ever seen a WiNRADiO; you sure
don't have to take my word for it. But the fact
remains....someone pulled your leg or you are being less
than truthful, or someone is terribly confused. There
might be other possibilities, but you sure as tootin'
didn't see a WiNRADiO.

Here....do yourself a favor. Fire up your Web browser
and go sneak a peek at a WiNRADiO at:

http://www.winradio.com/home/1000i.htm

There ain't no mistaking this one, dude.

Glad I finally found you guys! I just found out about the Icom PCR-1000 and the Winradio at Dayton last weekend (so I've been outta' touch for awhile..!) and that was the most exciting thing there in my opinion. I was all ready to buy the Winradio until they said it was not available in the external model yet and now that the heat of passion has cooled and I've had a week to think about it, I'm undecided. So how about some pros and cons of the two to help another sucker decide which one gets my $500.

I've been a ham for many years and have owned several pieces of Icom gear. Great quality! But, the Winradio seems to be the way to go software wise.....decisions, decisions. Talk to me!

The PRO-2050 I tested in Monitoring Times was remarkably
free of intermod and had very good image rejection.
The front panel ergonomics need improving.

From the FAQ article SCANNER RADIO REVIEW BRIEFS:

[...]

PRO-2050: 1998 vintage 300 channel Motorola trunk system
tracking base made by Uniden. Tight front end. Excellent
performance. Chassis-less, plastic construction. Squelch
and volume knobs too close and Manual key is hard to find.
IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM
modes are factory set and not selectable. 300 channels in
10 banks and a 2 second rescan delay may be programmed on a
per channel basis. Query feature identifies duplicate
memory channels. Our PRO-2050 scans at 78 channels/sec.,
skipping over empty channels. 10 priority channels. Up to
50 frequencies may be locked out from limit search. A
single pair of limits may be programmed for a limit search.
No Direct key or direct search facility. Factory
preprogrammed frequencies for police, fire/emergency,
commercial air, public service, and weather, but not marine.
See May 1998 Monitoring Times for a review which includes
quantitative test results.

Radio Shack has a cheap book that details it, but there are also illustrations on the packages of the parts. Basically you SHOULD run an aluminum (or copper if you don't mind green corrosion all over your roof)ground wire to the pole/tripod. 8 or 10 guage wire. Then you should install a grounding block/lightning arrestor where the coax(es) enter the house. These should be tied to the building ground (like the rod under your meter) in some codes, or have a 4 to 10 (differs by code, usually long) foot rod driven right near where the wire(s) go in.
It's more of an issue with short wave, but grounding coaxes at the building entry can help rid you of impulse & computer noise too, as well as protecting you from small lightning & static discharges. You antenna on the roof is very similar to a lightning rod & if you just run the cable in to your scanner without grounding, your scanner is the best path to ground for whatever hits the rod! You may also find your insurance won't cover an item that is connected to an improperly installed antenna.

Message-ID: <Loyunz0gstF5-pn2-25dJBWFZUFdd@slip-32-100-186-137.tx.us.ibm.net>
Source record: 160004

I'm looking to add a mobile scanner to my automobile and wanted
suggestions as to which antenna would be good for an external fender
mount on the car. I saw a RS 02-011 glass mount scanner antenna that
looked like a larger cellular type antenna but I do NOT want a glass
mount, only a fender mount where I drill the 3/4" hole in the fender
and run some RG59 inside the vehicle ending in a BNC connector.

Thanks!

Charles

My wife and I just purchased a Fisher Price baby monitor that has the voice scrambled. The cost (about $38.00) was comparable to other "non-scrambled" baby monitors. I was easily able to receive the signal (49.830) on my scanner but the voice transmission was totally unintelligible.

Your right about who did not show it, it was shown by the distributors.
You're wrong about what it was.

---------- cut ------------

>You still didn't see a WiNRADiO. They're not made
>like you described. So you were mistaken or confused,
>or the exhibitor was mistaken or confused or ?????

Then the distributors were "mistaken and confused".

-------- cut -----------

>It wasn't a picture of a new model. It's the *first*
>WiNRADiO, model WR-1000i.

Wasn't called "i" to distinguish it from the recently introduced
external ("e") model (a comment I read in this group), or was it called
"i" to show that it was improved?

>And WiNRADiO wasn't around "many years ago". So your
>observations and "facts" are becoming more confused
>all the time. Methinks you don't know what you saw.

Please see the May 1996 issue of RadCom in which WinRadio is advertised.
Also advertised is that it is to be exhibited for the first time in the
UK at the Picket's Lock exhibition. It was exhibited by the distributors
Rosetta Laboratories GmbH (see www.rosetta.de).

>I can tell you that there were other radios and TV's
>that came out on PC cards, some of which were low-end
>models, primarily for the broadcast bands. Perhaps
>you saw one of those "years ago" and now think you
>recollect it was a WiNRADiO.

Then it would not: cover 0.5-1300MHz, be called WinRadio, nor would it
be "distributed by Rosetta Laboratories GmbH". Having such an FM radio
card in one of my PCs I know what they look like.

>It wasn't. Not as you described it, anyway. You or
>the exhibitor or both....are in error, confused, or
>untruthful. Now which is it?

Were you at the Picket's Lock exhibition two years ago? If you were not then you do not know what was exhibited! Ask Rosetta Laboratories what they exhibited if you do not believe what I report. Then you can accuse them of being "in error, confused, or untruthful".

However this discussion only serves to show that you are clinically paranoid. Paranoia is when you accuse other people of being at fault so as to assuage your own bad feelings about yourself.

You got my vote! But sure to answer the following questions:
1.What are mods?
2.Where can I get cell (or cordless) phone freqs?
3. Who's Bill Cheek?
4. Why can't my scanner get cell phone freqs?
5. Where can I buy Radio Shack scanners?

Regency Informant 1 police scanner/receiver

This is the one that is designed for car use. About
the same size as the older radar detectors. Simple
operation (no programming required). Can mount it under
dash or clip to sun visor.

This radio is pre-programmed for state and/or city police
frequencies. Simply select the state where you are located
and the scanner will scan the commonly used
frequencies for that area. Very convenient for the
traveling types -- those in RV's, Campers, Truck drivers,
traveling salesmen, etc.

Also is preprogrammed to allow monitoring of the 10 National
Weather Service frequencies at the touch of a button. Again,
great for the frequent traveler.

Cosmetic condition good
Electrical condition excellent

With mobile power cord and mounting bracket.

$40 + shipping

email if interested

It can interface with a bunch of other scanners, essentially giving them
the ability to be trunktrackers. More or less the final desired state. :)

You seem to have difficulty with the following :
>> As I stated "...the producers of WinRadio showing an incomplete
>> prototype."
If you like to say which word you do not understand I will be happy to
post a definition.

>You have not established that the WiNRADiO company
>had anything to do with it. You only alluded to
>having seen it at a "show" somewhere. You could
>have seen anything and told it was a WiNRADiO.

I could go over back issues of RadCom and find the one advertising the
RSGBs national convention and exhibition in which the producers of
WinRadio advertised that they would be at the exhibition, but what would
be the use. I can not post a scan of it here, you would claim it was a
fake, all because you can not accept observation.

>I gave you the Web Site where you could go see
>a REAL one for yourself. Did you bother to go look?

Nice picture, but showing me a picture of a new product does not prove
that something different was exhibited many years ago, no more than
showing a picture of a modern Ford car does not prove that the model T
did not exist.

From my understanding and little use of this program it does work
quite well thru the sound card but to use the comm port you have to
have an interface fro it to work. Also once you have the interface
built chances are it won't work on your pentium system because about
90% of the pentium mother boards use a certain type of chip for the
comports and they cannot be addressed properly to work with the
interface I have a pentium TX chip set and the interface will not work
on it but works great on a 486-66, have picked up a pentuim VX chip
set but have yet to try it on there .

Dave,
We already have several. Between Bob Parnass, Bill Cheek, Bill
McFadden,
and myself, we manage to cover a lot of ground. You do raise some
interesting
points below but I think many newbies are either too lazy to read all
the
newsgroup articles(or skip right over them not realizing what they just
missed)
or don't know of the existence of, or how to use DejaNews.

> Here's some starter material:
>
> 1. Where to find _insert radio here_ reviews

Bob Parnass and I cover that.

> 2. Where to get frequencies for _insert state/county here_

Bill McFadden and I cover that.

> 3. Are there any mods for _insert radio here_?

Bill Cheek and the references to KC5KTO's web page cover
__some__ of these.

> 4. What's the going price on a BC895?

I don't know who would sign up to keep that current as it
changes. What about the other "hot" selling radios that
people are invariably going to ask for? That could easily
be a full time job tracking all the dealers(especially
troublesome for those you have to call since they have
no web presence) and maintaining a list for the best
price on each radio.

> 5. Rich Well's antenna reviews

I kind of cover that.

> 5. Where to find a Radio Shack manual for their scanner Pro-_insert # here_

I could add that as a new heading in my FAQ.

Any other suggestions?

Great books but I realize to keep costs down you have had to go to
smaller font that way more could be fitted to the page. But the
problem for me and many friends is that it has gotten to small to
read. I have a few of my older books but have given most away to older
friends that in no way could hope to read these newer ones.
Maybe you could look at how some of the American freq databases are
done and start publishing a cd, which would be cheaper to produce
than the printed one. With all the people that use the internet I
think you would find(or I hope you would) that people would welcome
the Canadian CD of Freqs. Maybe be able to put all of Canada on one
cd or a couple of cds fro 3 or 4 different areas of Canada. IT would
be a great addition to people with computer programmable scanners to
download a list of freqs and have my Windows 32 bit Pro-Turbo software
program my Pro-2004's 6,400 channels, and my future upgrade of my
Pro-43 to 800 channels.

With the cost of blank cds being under a buck in bulk I can see
people ordering a subscription to the cd if it were publish every 6
months if there were enough updates to warrant it.

I would have no problem paying a fair price for some that I could
read and make good use out of. Doing it this way would also help the
environment by requiring that fewer trees be cut down and less
pollution in the makings of the cd that all that paper costs to print
on. With the lower cost of the cd compaired to the book sales should
get better.

Anyways just my 3 cents worth.
Len

Joe,

Antenna Specialists

AnyWho lists 10 or so. Do you have an 800 number or URL?

I've seen departments around this area use a regular AM/FM

antenna, extended and soldered/welded at the proper length.

Because there's already an AM/FM antenna on the fender (solid mast mount), I was hoping to utilize this pre-drilled hole for one antenna that I could share between the auto radio and scanner. I haven't figured out the best way to do this but I had figured a coax splitter might do the trick. "Extended and soldered/welded at the proper length" makes me wonder what would be the proper length?

Thanks.

Charles

Too many milliamperes. 600mAh versus higher output, say 800mAh or even 1400mAh batteries.

I've seen comments that suggest scanner failure after applying to much power. However, these posts have concerned DC adpaters rather than higher output batteries.

here in Ohio you can hear them (only when someone is
talking of course) The range is real limited tho.....
they are on all the time......as long as the car is running.
Also not ALL patrol cars have them installed......so I wouldn't
bet my license on its effectiveness

That's what I've learned.

Would you have an opinion about using higher output nicad batteries,
say something over the stock 600mAh batteries?

Thanks!

Charles

Kevin,

- Instead of drilling a 3/4" hole in your fender (unless this is really what
- you want to do) why not get a $6.00 L bracket to mount on the fender.
- Then if you ever want to remove it there will not be any holes showing.
- You can get them at any radio supply store.

You know, there's already an solid mast antenna mounted on the vehicle
and I was hoping to utilize this hole with a different antenna that
could service both the auto radio AND scanner. What's your opinion?

Charles

Sure. The "producers" of WiNRADiO would not have
shown an incomplete model in public. So it wasn't
the producers, and neither was it a WiNRADiO.

> >You have not established that the WiNRADiO company
> >had anything to do with it. You only alluded to

> fake, all because you can not accept observation.

You still didn't see a WiNRADiO. They're not made
like you described. So you were mistaken or confused,
or the exhibitor was mistaken or confused or ?????

> >I gave you the Web Site where you could go see
> >a REAL one for yourself. Did you bother to go look?

> Nice picture, but showing me a picture of a new product does not prove
> that something different was exhibited many years ago, no more than
> showing a picture of a modern Ford car does not prove that the model T
> did not exist.

It wasn't a picture of a new model. It's the *first*
WiNRADiO, model WR-1000i.

And WiNRADiO wasn't around "many years ago". So your
observations and "facts" are becoming more confused

all the time. Methinks you don't know what you saw.

I can tell you that there were other radios and TV's that came out on PC cards, some of which were low-end models, primarily for the broadcast bands. Perhaps you saw one of those "years ago" and now think you recollect it was a WiNRADiO.

It wasn't. Not as you described it, anyway. You or the exhibitor or both....are in error, confused, or untruthful. Now which is it?

5215. Freq for Blue Angels, AAFB May 17, 1998

Newsgroup: rec.radio.scanner
Date: 1998-05-22 00:00:00 UTC
From: Wally <wally@home.com>
Message-ID: <3565B3EE.709D5507@home.com>
Source record: 159835
Cross-posted to: rec.radio.scanner,alt.radio.scanner

In case anyone's interested, the Blue Angels were using
238.150 MHz at Andrews Air Force Base on Sunday, May 17.

This sounded like the lead plane, since every stunt was called
out before it was done. Many were called out using snatches of
songs (for example, a move directly upwards was preceded by
the first few bars of "Up we go, into the wild blue yonder").

Show control ("Air Boss" was on 124.000 MHz).

Many thanks to everyone who posted freqs before!

Wally

No, they (Renewals) can be recharged about 100 times when used in a scanner,
remote control, etc.

Haven't you heard of the "Memory Effect" on NiCds?! I will never use them again.

The output is exactly the same as a normal Alkaline. However, you can't really use any charging circuit besides the Renewal Power Station. I usually charge one set while using another - works great!

I own one, have had it for 3 years now. It is a good little double conversion scanner, battery life is good, audio sufficient. Not especially intermod prone, not many birdies. Search speed is blindingly fast! 100 memories more than enough for most purposes. Cellular images very strong in the 896 to 915 mhz range. NOT unblockable without changing main CPU with Australia model. I paid 200 CDN for it then on sale (never buy from RS unless item on sale), it has given me good service. All things considered, it's a pretty good little radio with all the important features (Search,10 Banks, 800, Priority); I think as a starter or for a casual user a very good choice for the money.

5224. Icom Charger

Newsgroup: rec.radio.scanner
Date: 1998-05-22 00:00:00 UTC
From: saturn@ix.netcom.com
Message-ID: <3566107E.69E9@ix.netcom.com>
Source record: 159844

Hi Folks!

I'm new to the country, from Australia. It was there that I purchased an ICOM IC-R1 hand-held. I've recently immigrated here, and have brought my scanner over here with me. The problem is, however, that my charger won't work (or doesn't seem to be working!) I plug it in via an Aussie-US plug converter, and when the unit is on, the RX indicator flashes on and off with corresponding bursts of static. When I leave it off for a few hours, the scanner simply won't charge.

There doesn't seem to be any damage to the unit.

If I can't use this charger here in the States, do I have to buy another Icom charger, or can I use a similar unit from, say, a Radio Shack store?

Thanks for your help,
Phil.

There are several mods available for this scanner. Unfortunately for you, I do believe that you are refering to a simple modification that will open up the cell phone frequencies. In that instance there are none. Can the range be opened? Yes. To do that you would have to either have a frequency converter, do a virtual downconversion, or supply the PLL and BPF circuitry with coded info to tune these freqs. The latter can be accomplished by an unblocked OS535 interface or you can roll your own using a PIC chip or a homebrew ISA card setup.

I know of no secure baby monitors. Your best bet would be to run
a wire if you can, or use a commercially available digital spread
spectrum phone as an intercom if there is one available.
I remember that some of the old 46/49 MHz phones could be used
as an intercom between the phone and the base station.
Good luck,
Al

> Shack store?

Looking at that charger, the BC-74A, it's rated at 12V, 200mA
and a positive tip.

Radio Shack does have a few AC adapters. I have one of their
universal adapters that comes with several plugs and can be
set from 3-12V and allows for configuration of postivie or
negative tip. There is a plug that fits the R1 jack, HOWEVER,
this charger(#273-1662) puts out 300mA.

Not a big discrepancy overall from the BC-74A spec but that
is 50% more. That will mean your internal NiCd will charge up
quicker but I'm not sure if that amount of extra current
will overheat it(thus reducing its lifespan) too much or
not. And from what I can see, this is the only 12V adapter
that comes close to the 200mA needed.

According to the R1 manual, the internal NiCd is rated
at 300mAh. So I'll have to assume there is some sort of
current limiting inside since the charging time is spec'd
at 15 hours! 200mA at 15 hours is 3000mA, or enough to
charge a 2500mAh battery (using 120% charging rule). So
you could get away with roughly 10 hours at 300mA, if
the extra current doesn't generate damaging heat.

Since it appears they are current limiting the 200mA,
for 300mAh to charge in 15 hours is roughly 25mA or

12%. If that's true, then the difference for using
300mA might be negligible and thus nothing to worry
about.

Looking at the latest AES catalog, I don't see a listing
for the BC-74A but most of the AC adapters for the iCOM
products run $30. The Radio Shack price on the above
adapter runs $13.

Decisions, decisions!

Whoa!

Now Al, I just happen to have one of these phones your speaking of - with such an intercom. That - I can easily pick up with my Uniden SC. Also, a wire is a good idea but a little extreme. Realistically, I'm looking for a baby monitor that 90% of the scanners and people using them won't pick up.

> to the speaker..

If you stop and think about that one, perhaps
you could rephrase the question. Basically,
a "tone finder" or some kind of a tone display
serves that capacity. It would be of no other
use in a scanner, since.........

> or do u have to twist a knob through the tones till u
> find it??!!

Well, there is no earthy use for CTCSS unless
your tone board is set to a specific tone so
that only the desired signal breaks squelch.
You'd not know this desired signal unless you
had a list or someone told you or had a "tone
finder". But you'd have a tone finder only
if you wanted to set a particular tone for
some crowded frequency.

Basically, CTCSS kits and mods let you choose a
tone and then set it active or in standby. More
enhanced kits and mods might offer a tone finder
but most don't.

You can make a cheap tone finder if you have a
decent frequency counter and build an external
low pass filter with an upper cutoff at
about 250 Hz.

Bottom line is that "tone finding" and CTCSS
operations are two different animals.

No, my stance is TRUTH, including the search
for it, when there are obvious discrepancies.
YOU seemed to not allow for a margin of error
in what you saw, what you think you saw, or
what was shown to you. You speak as if it
were a cosmic truth.

It isn't. Someone erred. Or lied.

> As I stated "...the producers of WinRadio showing an incomplete
> prototype." Kindly tell them that you consider them to be guilty of the
> offence that they pulled my leg, or were less than truthful or are
> terribly confused as you suggest above.

You have not established that the WiNRADiO company
had anything to do with it. You only alluded to
having seen it at a "show" somewhere. You could
have seen anything and told it was a WiNRADiO.

I gave you the Web Site where you could go see
a REAL one for yourself. Did you bother to go look?

Well, your statements look like they came from
advanced stages of the FUD camp.

Bottom line, here, fella, is that you did NOT
see a real WiNRADiO. I don't know what you
saw, or what wool was pulled over your eyes,
or what state of confusion you were in, but
your description was NOT that of a WiNRADiO.

And THAT is a fact.

So, in essence, you were spreading FUD.

Instead of drilling a 3/4" hole in your fender (unless this is really what
you want to do) why not get a $6.00 L bracket to mount on the fender.
Then if you ever want to remove it there will not be any holes showing.
You can get them at any radio supply store.

Tony,
A little off subject but if you are a race fan try going to www.
broadcast.com (used to be audionet.com) . Every once in a while they feature
Nascar or Cart race pit to crew conversations (just like you were listening on
a scanner). I listened to a big Nascar race on my computer while watching it on
tv earlier in the season.. The computer will lag behind just a few seconds but
you hear some really interesting stuff, especially when a crash occurs . Your
computer will need a sound card and real audio.
Hope this helps . Charlie Fox

>a 300 channel PRO-67 for about $130, which seems like quite a deal....
From the FAQ article SCANNER RADIO REVIEW BRIEFS:

PRO-67: 1997 vintage. Good portable 200 channel scanner
using up conversion. Replaces PRO-51 and has better image
rejection and super fast scanning. Service Search lacks
police frequencies. Fixed AM/NFM modes and step sizes. Can
lock out up to 20 frequencies during a search. Can recharge
AA cells within the scanner. Frequencies adjacent to the
cellular phone bands censored so our PRO-67 will not receive
868.9625 or 823.9625 MHz. Intermediate Frequencies are
254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67,"
by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for
a review which includes quantitative test results.

In my Monitoring Times review, I wrote:

Performance
"..Our PRO-67's small speaker produces audio of average quality,
which distorts as the volume control is advanced. Squelch action
is acceptable, with the proper amount of hysteresis. The PRO-51's
squelch tail is too long, producing a long noise burst at the end
of each transmission. The PRO-67 squelch tail is shorter,
though still noticeable."

"We took the PRO-67 on vacation and put it to work monitoring
local police, business, and motel frequencies. Practical use,
along with test bench measurements, show our scanner has little
intermod and adequate sensitivity (see graphs). The PRO-67 and
BC-235XLT share the same IF scheme, and the 254.4 MHz first IF
accounts for very good image rejection - almost 60 dB at 155.5 MHz.
That said, we do receive an image of TV channel 26 audio (547.75 MHz)
near 39.05 MHz when using an outdoor antenna."
"Our PRO-67 is clean in the 160 MHz railroad and 800 MHz
land mobile range, though we experience some adjacent channel
interference from stations on UHF 12.5 kHz away when using an
outdoor antenna. We measured the PRO-67's cellular rejection
to be 49.5 dB in the VHF-low band. The signal-to-display frequency
relationship on the VHF-low band is:

actual transmitter frequency (in MHz) = 763.2 + [2 * display frequency]

"For example, we can hear an 870.0 MHz signal when the PRO-67
is programmed to 53.4 MHz, though the 12 dB SINAD sensitivity
[to cell signals] is only 89 uV - on par with a turnip..."

It's $18 for the shipping and handling, and no, they don't personally deliver it to your door. But that still adds up to lower then anything I've seen elsewhere. And the deal has been extended until July 31st . . .

From: grohe@galaxy.nsc.com
Message-ID: <3564f718.378211@139.187.81.1>
Source record: 159878

On Thu, 21 May 1998 00:12:22 -0400,
in the newsgroup rec.radio.scanner,
paul and jacki <jackid@gwis.com>
from Gateway to Internet Services thoughtfully posted:

> Hello,
> I've been seeing posts about Highway Patrol mobile extenders. Can
> someone please tell me what they are (not the frequency, but their
> function).
> Thanks!

Here, the California Highway Patrol uses main channel frequencies
in the 42MHz range. These frequencies are great for long
distance, but because of the large physical size of the antenna
required at 42MHz, they do not work well on portables.

If the officer get's out of the car, there is no way to talk to
dispatch without getting back into the car.

To solve this problem, they have devised a clever little system
to allow the officer to use a portable to transmit through the
car's (more powerful) radio.

The system consists of a low power VHF-Hi band walkie-talkie and
a matching transceiver that is connected to the car's main 42MHz
transceiver.

But because the extenders use the same simplex frequency
(154.905MHz), there is a problem when two patrol cars are next to
each other. Both will re-transmit at the same time.
Squeeeeellll!!!

To solve this, while re-transmitting the main channel, the car's
extender transmitter stops transmitting for a very short time to
listen and see if another extender is already transmitting. If it
detects another transmitter, it stops transmitting (for about
50mSec every second). Each extender has slightly different
timing. This gives the extenders their characteristic
"squeel-chop-chop-chop" sound.

This also allows any portable to access any extender in any car,
without having to match each portable with each car.

Not bad for a 20+ year old, non-digital system!

However, these extenders are not turned on until the officer
leaves the car. So don't try to use the extender signal as a "cop

detector". There were some devices sold to detect these signals
("beartrakcker"), but they did not work well because of the
previously mentioned reason.

Cheers,
Paul Grohe

Source record: 159879

WE SUPPLY WOUND CORES FOR SPECIFIC POWER AND RF NEEDS .
WEALSO SELL TOROID SOFTWARE

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...
Down load a demo or just view the software main screen at our web

You might want to "check" on this..... I think you will find
the officer turns off his handie-talkie unit(save battery power,
or what ever reason) but the mobile unit (in the trunk) stays
active! making the bear tracking system work.

Attention Fellow Computer Enthusiast:

***** C O M P U T E R S O F T W A R E F R A U D A L E R T *****

%%%%%%%%%% C O R E L S O F T W A R E E X P O S E D %%%%%%%%%%

HERE'S A TIP TO HELP YOU AVOID SOME FUTURE GRIEF (AND SAVE SOME OF YOUR HARD EARNED MONEY)

PC World Magazine, in their February issue made reference to a particular software title as

'THE SOFTWARE FROM HELL'.

I've never used the product they were referring to, so I can't comment about it.

Nevertheless, if PC World had been talking about software from

COREL CORPORATION (Word Perfect, etc), it would have been MOST APPROPRIATE.

COREL SOFTWARE PRODUCTS, IN ALL THEIR FORMS, TRULY DESERVE THE TITLE

****** S O F T W A R E F R O M H E L L ******

because they are buggy (and dysfunctional) beyond belief. Corel products make Microsoft look like the knight in shinning armor, even including Windoze 95.

YOU CAN'T READ INFO LIKE THIS IN THE COMPUTER MAGAZINES BECAUSE COREL SPENDS FAR TOO MUCH MONEY VIA ADVERTISING REVENUE WITH ALL THE COMPUTER PUBLICATIONS, AND THEY DON'T DARE EXPOSE ONE OF THEIR BIGGEST ADVERTISERS, FOR REASONS WHICH SHOULD BE OBVIOUS. THEREFORE, WE CAN ONLY HOPE TO PASS THE WORD VIA NEWS GROUPS AND SIMILAR OUTLETS.

Corel Corporation, a Canadian firm, based in Ottawa, Ontario, has zero regard and zero respect for their customers, and is probably the best example of why Ziff Davis (publishers of dozens of computer magazines, both on the PC and Mac platforms), are now calling for a mandatory (and legally binding) 30, 60 or 90 day software money back guarantee.

Using data from Corel's own website, the following is more than sufficient proof to demonstrate the dysfunctional character of Corel's Word Perfect product:

THE FOLLOWING BUG LIST IS TAKEN FROM COREL'S WORLD WIDE WEBSITE:
==========

ftp://ftp.corel.com/pub/WordPerfect/wpmac/-WPMac ftp Index.html

(scroll way down, almost to the bottom)

What follows is the list of bug fixes initiated by Corel in an attempt to repair their cockroach infested product known as Word Perfect, version 3.5, which can easily be construed as a clear admission of bugs which existed with version 3.5 as shipped to customers on CD ROM. What makes this issue all the more criminal is the fact that Corel refused to inform customers who sent in their warranty registration cards that bug fixes had been released for this product. Corel Corporation refused to send warranty/registered customers the patches on floppy disk, and if this was too expensive, Corel Corporation even refused to send registered customers a postcard informing their customers where they could find the patches on the Internet. Customers were simply left to struggle with a totally dysfunctional product. And customers like myself who finally figured out Corel Word Perfect could NOT be made to function properly, and who first requested assistance, were ignored, and who later requested a refund, were also ignored.

TO THIS DAY, 17 MONTHS AFTER THE PURCHASE OF THE DYSFUNCTION AND COCKROACH INFESTED COREL WORD PERFECT PROGRAM, THIS COMPANY CONTINUES TO IGNORE ALL INTERNET E-MAIL MESSGES AND ALL UNITED STATES AND CANADIAN POSTAL SERVICES LETTERS.

==========

Corel Document ID: 10339

The information in this document applies to:
WordPerfect 3.5 for Macintosh

This Updater works with all versions of Corel WordPerfect 3.5. Including: Novell WordPerfect 3.5, Corel WordPerfect 3.5.1, Corel WordPerfect 3.5.2 and Corel WordPerfect in the CorelDraw Suite.

The Corel WordPerfect 3.5.3 patch replaces all previous patches for WordPerfect 3.5, including the Corel WordPerfect 3.5.2 patch shipped in October of 1996.

Fixes in 3.5.3 patch
==========

- Conversions should now function normally under System 7.6.
- A bug was fixed that repairs some display problems.
- Sporadic warnings that the common library could not be found will no longer occur.

Fixes in 3.5.2 patch
==========

- Text Selection now works properly.

- The Print Envelope feature will print addresses in the correct position on the LaserWriter 8.4 printer driver.

- Deleting to the right at the beginning of a line will no longer cause the cursor to reposition incorrectly in the text above.

- Deleting just before a Style no longer causes the cursor to reposition incorrectly and delete text within the Style.

- Editing a document in ?Show Codes? no longer causes the cursor to reposition incorrectly.

- Headers/Footers with text attributes (bold, underline...) are no longer affected by text attributes that cross a page break.

- Deleting addresses in the Print Envelope delivery or return address window now functions properly.

- The German Dictionary no longer stops and marks incorrect every word that contains a ? (esset).

- The French Dictionary on a Power Macintosh no longer stops and marks incorrect words that contain a ? (acute).

- Delivery Point of a bar code is no longer automatically calculated.

- Import of tables from various document types has been improved.

- The title of the ?WP6.x Export? now reads ?WP6.x,7.x Export? in both the patched and resale CD product from Corel.

- HTML export now saves Corel WordPerfect graphics or .wpg formatted images as JPEG?s.

Fixes in 3.5.1 patch
====================

- Editing some long blocks of Japanese characters will not crash the computer.

- Screen display is faster after scrolling through large documents or tables, or making editing changes.

- Captions can now be positioned above a graphic or text box.

- Return and delivery addresses in Print Envelope will now allow 255 characters (including line breaks).

- Dictionaries are now listed under the Dictionary menu instead of the Check menu.

- Ruler Bar display problems with PCI Power Macintosh computers have been fixed.

- WP 6.x and WP 7.x conversions can now be canceled.

- While working in subdocuments?such as headers or footnotes on black and white screens, Corel WordPerfect does not quit unexpectedly when clicking in the ruler area of the subdocument.

- Zip codes beginning with zero which did not have extended zip code digits now function properly in the Print Envelope feature.

- Font menus in Preferences and Print Envelopes now work properly on small monitors.

- Cleared tabs will no longer unexpectedly reappear on the ruler.

- Hyperlink copy and paste are now working.

- Cell Protection now disables the deletion of the contents of a cell.

- The bottom border of a table which crosses a page break is now visible.

- Patterns in a cell will no longer disappear when performing a Split or Join.

- Joining with the first cell of a table now functions properly.

- Row selection of tables in a text box is now available.

- Scroll bar does not stick when scrolling.

- Corel WordPerfect will use the Language Resource file designed for your system if present, or default to English (USA).

- Page Setup is now enabled in the Print Envelope feature (this allows the selection of paper sizes and envelope trays).

- Changing QuickCorrect preferences with no documents open will no longer crash the computer.

- Tables and Page Borders now work together.

- The PowerTalk Mailer can exceed 4096 characters.

- In the new Corel WordPerfect 3.5 CD-ROM, Norton Utilities will no longer report an error in the WordPerfect Installer Read Me. This fix is not available in the patch, but if you use Norton Utilities, we suggest you delete the WordPerfect Installer Read Me since it is not required for proper operation of the software.

- Corel WordPerfect Dictionaries and QuickCorrect word lists will no longer be replaced during installation.

==========

Postscript:

The above represents the bug list for Word Perfect 3.5, as I purchased this product, these revelations coming directly from Corel's website. Considering all these problems, it is little wonder that Ziff Davis Publishers are now suggesting we have a SOFTWARE LEMON LAW to protect computer consumers from future issues of this sort of software larceny.

If the reader will examine the websites of PC Week, PC World, and a few other leading PC-platform computer magazines, he will discover that Corel's Word Perfect, Suite 8 (the latest offering from Corel) is likewise

full of bugs. Don't take my word for it--- check it out for yourself.

MORAL OF STORY::::

SAVE YOUR MONEY--- DO NOT BUY ANYTHING WITH ���COREL��� ON THE LABEL, WHETHER IT BE FOR IBM COMPATIBLES OR THE MACINTOSH !!!

5257. Re: Making your our outdoor antenna

Newsgroup: rec.radio.scanner

From: derickam@aol.com
Message-ID: <1998052205573200.BAA24574@ladder03.news.aol.com>
Source record: 159883
Body handling: HTML body converted to readable text

> I was wondering that my TV station in my area that I enjoyed watching, I
>kept

>fixing the antenna for that station and its picture did not clear up.

Clear up?? Does it have snow, ghost images, what kind of distortion?

If it is ghosting, which you see two or more of everything you are really close to the signal and it is approaching your antenna from different directions, arriving at different times causing these "ghost images". "I" have a directional antenna on a rotor and I point the antenna away from the signal reducing the gain so the ghost images do not appear. I have one really strong station in my area that requires me to put a signal atten of 10db inline with the antenna when I view it.

"I" am simply stating what works in my case and am not claiming to be an "expert".

If the signals are weak (snowy) a directional antenna will help pull them in, better, and yes you may use the same antenna for FM broadcast. This system works best with a rotor. Radio shack sells a pretty good rotor and controller. I have also picked them up at garage sales and swap meets for next to nothing (under $10) with the control unit.

Radio shack also has very good "I my opinion" directional antennas for the price, but they by no means have a monopoly on the market

.>1. What do you need in order to make your own outdoor antenna

Unless you have no altenernative or doing it for fun, it is usually cheaper to, just to buy it. If you must a good place to start is at a local ham radio store in your area. There is also much on the web on the subject of antenna's. A good jumping of place "In my opinion" is http://www.arrl.org/field/club/ to find a local club. Hams love to help folks out with this kind of stuff. However make your own decisions, it's your time/money.

>2. What are the advantages of an outdoor antenna?

Have a clear unobstructed shot at the signal, if directional you can aim the unit at weak stations and get better reception. You can also reduce the signal of stronger ones by aiming it away from them.

>3. What stations should you pick up(Ex. NYC from Pennsylvania)

This is a hard one depends on where you are, if you live in a hole it probably will not help much (generally speaking). If you live on top of a mountain it may not help much because you will probably pick up everything with any kind of

antenna. Generally it will help you pick up anything that is within line of sight of the antenna better.

"My" opinion on this subject is similar to sound systems, put your money into the best speakers you can buy then get your stereo. I put alot of time and money into my antenna system for my television recently, them bought my new TV. I have never regetted it.

again...

"I" am simply stating what works in my case and am not claiming to be an "expert".

Also another good source, email: Neutrodyne@aol.com, he seems well versed on the topic of vhf/uhf antenna's.

Dave,
Buy a winradio, you won't regret it.
Buy an Icom, I dunno......used it for 30 min tops....
Cannot rant nor rave about something I have not consistantly used.

An opinion.

Brand loyalty got nuttin to do wid it.....I have several
icoms-706,7000,w32a,2710h, soon to have 756.
Winradio was there right time, right price, right features "For me okay?".

Check out the "nitty gritty" on their websites you will find which is right for
ya (maybe neither, DOHHHH...). A pro2006 with an interface is also way cool...
I would like to be able to have both PC type radios, but I need more antenna's,
wire, computer junk yadda, yadda.........

Rumor has it you can only listen to so many at once...naaahhh tell me it aint
so.

http://www.winradio.com/home/news.htm
http://www.icomamerica.com/

also

http://www.grove-ent.com/grove/gr_wr.html

They sell them both, this "one" of the side by side comparisons.

It's your money and your decision, git informed. :)

good luck! =)

Okay, I have my asbestos suit on go ahead flame away. :o

If the extender in the car was on all the time you could hear all there calls on that frequency. In this part of California you can't. CHP officers I know locally tell me the handheld is left on for the entire shift and the car unit is onnly turned on when needed.

Maybe in a few limited instances, but a normal installation
of a extender system will result in the extender NOT being
turned on, until one of the two situations is encountered.

1. (Normal) When the officer wants the extender on, he turns it on,
with a switch.

2. (feature) When the officer pulls the portable from the
convertacom, it automatically turns the extender on. This was
REAL prevalent back in the MX series days, now with the
convertacoms often consisting of nothing more than a charging
cup, it is not used as much.

I would also note, that I use the product name convertacom as
a catch all, for all the products that charge, convert, hold, a
portable in the car or truck. Different manufacturers have
different names, such as docking booster, etc. Different radio
series have different vehicular charger names, capability, etc.

The data base avial on Industry Canada's site is great for non Police ect...

However it (the database) is avail to anyone , its NON PROTECTED.

I did fing Police freqs in that list , they seem to list Police etc...in the CITY OF XXX

IE : City of Sudbury , will hail a list of the EDAC's system used there...

However most is like I said Non Protected , mostly Taxis , etc...

A good site for freqs would be...

Ron Katz site , well Ron here is an Olive branch... :)

He seems to keep a rather good / updated site...

I will change my sites name so there is no confusion with Rons site...after all I must call a spade a spade....his site (Rons) is a good one!

So is Rich Wells...also a GEM of info there...I dont have the URLS handy...put a simple call on this NSG should get the URLS , bookmark em...they are worth it.

I belive my site is a good source for Sound Card Drecoders....I am not in the Freq Bizz....

A. I am too busy with wotk

B. I havent the time to head off to every city to Freq Count services.

But some ppl have the time...hats off to em!

again , Ron pls accept this Post as an Olive Branch....I will change the name of my site...I see as calmer heads prevail on my part it seems only the right thing to do.

I am truly sorry to have caused you any problems...

I will add Links to Excellent sites soon on my web page...

Will Include : Well's MEGA site! (a must have Bookmark)
Katz wealth of ontario / Canada freqs!

Hats off gentlemen for a job well done...

- 73

Happy Signals!

Roger

De VE3 ECB (former call)

http://members.xoom.com/ontscan/

(the URL will change soon...so do visit often in the next few weeks to see the new URL...)

Ok, I've seen way too many of the same messages and responses floating around for two years now. Can someone roll a FAQ for the group PLEASE?!

Here's some starter material:

1. Where to find _insert radio here_ reviews
2. Where to get frequencies for _insert state/county here_
3. Are there any mods for _insert radio here_?
4. What's the going price on a BC895?
5. Rich Well's antenna reviews
5. Where to find a Radio Shack manual for their scanner Pro-_insert # here_

I'll volunteer if no one else will do it.

Thanks for the kind words, blush...

>I did a search and it seems Radio Shack has discontinued the Ontario Edition
>of Haruteq....BC..SASK...etc...were all avail on RS Computer...I know they are
>still in stores...but to re order the Ont Haruteq from shack is not possible !
The previous edition was indeed discontinued. The current one, December 1997
(20-8100, ISBN 1-895604-11-7) is available as usual.

>Bart had a falling out with RS...
Nope, fortunately completely untrue

>or perhaps he sold out!....
Nope. I've been doing them since 1983, worn out several computers over the
years, got reading glasses, but still going at it. I must admit though, from
time to time it's been a tempting thought :)

>has no ONT books left to ship out!! ((((SHRUUUG))))
The first printing was sold out and the second printing is available once
again.

Thanks to all for the great support over the years,

Bart Veerman.

P.S. The new Qu&#65533;bec/Martimes edition will be out soon.

Hey! such a broad statement is invariably incorrect. Nothing and nobody
is 100% bad, or FRAUDULENT.

I've used CorelDRAW for over 6 years and have no complaints. It is a
great drawing program. I've used it to make everything from brochures to
letterhead & stationary, adverts, invitations, etc....

Looks like all of your complaints are for the Word Processor. Why not
limit your comments to the subject you are complaining about, or show
proof that ALL their products are junk.

Mark N6WBC

BY THE WAY, HOW DOES THIS RELATE TO HAM ANTENNAS AND EQUIPMENT??????

Oh?...and just how do you listen to a digital, spread-spectrum, 900mhz
phone?
You may hear a little noise, but you will not hear the conversation.
VFO's are not the answer.

Hi:

I'm looking for recommendations on mobile scanner antennas. I'm also seeking info on magnetic mounts. I'm thinking of doing some monitoring of 108-137 on the weekends when I'm out tooling around in my truck.

Also, where is the cheapest place to purchase the DC adapter and mounting bracket
for the BC895XLT?

Thanks much for your help.

-Scott :^)

5285. Harris County, TX trunk system has me baffled

Newsgroup: rec.radio.scanner
Date: 1998-05-23 00:00:00 UTC
From: Linda Thomas <Linda.Thomas@dialaccess.com>
Message-ID: <3567028c.0@news8.kcdata.com>
Source record: 159711

I'm hoping that someone can help me out here. Please reply directly as I don't always get to read this group in a timely manner.

I just got a new BC895XLT trunk tracker and I promptly went to enter the trunk frequencies. Here's where the first problem begins...

From the 1998 Police Call, I get a set of 25 frequencies 856-860 at .2125, .2375, .4625, .4875 and .7125. These are all registered as WNBZ674.

There are another set of 26 frequencies between 866 and 868 registered to WPKL474.

So I'm thinking, "ok, there are two distinct systems" and I go on to look at the first one. Here it gets stranger...

There are two control frequencies in the first set. Depending on which I program in, I get different traffic. Is it possible that the first set of frequencies itself encompasses two systems? If so, how can I tell which go with which control? Or am I missing something else and just confused?

The second set of 26 frequencies is much less active overall but it also has a control channel.

I know (or at least think) that a trunked system can't have more than 30 frequencies so I don't think the two sets of frequencies could be combined into a 51 frequency system.

Does anyone know how I can figure this out? In the first set of 25, can two distinct control channels share the same set of frequencies? If this is the case then I can only trunktrack one at a time.

Any insights would be greatly appreciated!

-Linda

Now With a New General Class Question pool coming soon, I thought the ARRL would include these as "bounues"

1. a "My first Jamming the Liberty Net Experiance" By K5BLB
With a sidebar entitled "How to do a Tarzan Yell"

1a W9ART on how to "blah,blah,blah,blah" for hours on end with losing your voice should you want to do it on field day.

2. KK7HO's How to make threats on 3950 effective. With addresses of people standing by that will do anything for "$500"

3. This Burt guy on how to get yourself kicked off a VE team.

4. The ARRL's mission for the year 2000 $$$$$$$

5. Front cover introdutcion - "When you get your New General class, Be sure to any jamming, polictcal dissussions, stay on 3950" That where we want them" -- ARRL President. .

>That's three years ago; not "many".

A figure of speech, but the point is not that it was many or a few but
that it was advertised and exhibited then. A fact you deny without
checking, this confirms your nescience.

--------- Abuse and repetition cut -------------

Taken from another branch of this thread:

In article <3566d63f.30477106@news2.cts.com>, Bill Cheek
<bcheek@san.rr.com> writes
>
>There was also a precursor to WiNRADiO that pretended
>to cover a lot of the spectrum, but I don't know
>anything about it. It came and went before I was ever
>aware of it. As I understand it, it may have inspired
>the WiNRADiO people to develop theirs.

Is it possible that Rosetta Laboratories were showing this in the UK as the WinRadio between first announcement of the product and production quantities shipping to the USA? On the Winradio web site I read that WinRadio Pty was established to manufacture and develop this product in August 96, in May 96 the product was described as manufactured by the WinRadio division of Rosetta Laboratories GmbH. Could the product I saw have been this precursor, manufactured by the same people and quietly changed after a few months?

It is not unusual for manufactures to supply reviewers with pre-production samples for photographic and feature review. They do however usually state this and require that it is not used for a technical performance review.

Hello .

Because of a complete CRASH on my PC , I unfortunatly lost all the answers that I got from all of the nice and helpfull people from all over the world (I really hate Microsoft Windows 95 ver. A)

Could all of you that answered my request for help to expand the frequency coverage on an Icom ic-h16t (With MRH 45 Software) , please send me your answers again , PLEASE ! ! ! ! ! ! !

For "NEW" readers : The thing I would like to do , is to expand the freq-coverage on an IC-H16T as much as possible . (I don&#65533;t need it to cover the UHF area , and I know that the IC-U16T is the radio I nedd to get the UHF band)
This mod. is being done in the <dEALEr> mode , and I have the access code for programming .
The code is not the 159357 - code , atleast not here in Norway / Scandinavia . (I don&#65533;t know about other versions / countries outside Scandinavia)

The radio covers from about 136 - 180 MHz on RX and from about 103 - 180 MHz on TX at the moment , it has 100 Channels (99 Channels for regular use , but the Channel 00 is for the <PAGER> option) .
If I could get it to cover from about 103 to maybe 260 MHz (or higher , if possible) I would be more than pleased .

So if anyone could send me instructions about what adress(es) I have to change to get this mod. done , I would be more than happy . And maybe I could help you with something else one day ......

And to Sam (I don&#65533;t remeber your lastname or Mailadress) from Australia that would like to learn about the 100 Channel bit , please send me an mail , so I can send you the info you asked for .
If my mind don&#65533;t plat with me , you said in your mail , that you had an Midland XXXXX , that should be the same as the IC-H16 .

Thanks in advance .

Ok tnx Cousin Jethro. I'll buzz by your site and see if I can figure out how to post my message about Corel.

Thanks

I notice there are replies favorable towards Corel's bullshit products. Sure, there will be some who like it and and have no problems. No, not everything is bad, as the one fellow said.
That's true

I just look in the recent magazines and when writers for PC World and PC Week say Corel Suite 8 is all fucked up, then it most likely is fucked up.

But you can't look for accurate reviews in Macworld cuz they're all friggin lyars. They say EVERYING IS BEAUTIFUL. If it runs on a Mac, then it must be ok. Macworld, totally unreliable reporting. Too bad, really, cuz the Mac is a nice machine. U should try one, Jethro. I've tried your PC.

I'd rather take the word of magazine reviewers who find lots of problems with a product than an inexperienced non-professional computer ""hobbiest"".

Don't fucking mantter, man. Just look at Corel's own website, review all their bug fixes and you get the picture. Denying it don't fix it.

Nothing new here Jethro. I hear you slugging it out on the radio. It's all good entertainment. Very funny. U'r both right, both wrong.

Everybody bitches, moans, jams, pontificates.

I don't pay much attention to all the politics anymore. There are so many WHITE TRASH white people where I live, I just wish Kevin Alfred would come down here and have a look for himself. White folk need to clean up their own gargabe pile before bitching about negros and jews. That's how I look at it.

And the Christians need to examine their own dirty laundry before pontificating about all the crooks in congress, etc. Most of these politicians they bitch about are Christians. That's the pot calling the kettle black.

Christian logic is ILL-logical. A hodge-podge of confused thinking.

And Side Car Sidney needs to get himself a brain.

Ditto for KE2LO. Ditto for way too many of those turkeys on 3950. I've heard frogs burping in the night that make more sense than some of the shit I now hear on 3950.

Doesn't much matter tho. Things are going the way they will, and are not likely to change because people are greedy, and lazy, and have no idea who their enemies are. And even if they did, what would they do about it?

Uncle Vic has nothing better to do than bitch about Slick Willie. Who the hell cares who Clinton is fucking??? How wasteful can one get? If Vic did get Slick Willie impeached, would he be happy with Al da whore Gore?? No, then just more bitching to impeach Gore. Yes, a never ending spiral of nonsense.

So why get upset???????????

KJI needs a conscience, which he's never had. A few pins in his coax, too. And a muzzle for his dirty mouth. Some cobwebs in the final of his amp.

KJI, the ultimate scumbag of ham radio.

And someone ought to go drown that fucking moron AB5 Monkey Vomit character.

Oh me, 3950 never changes, does it? But if it did change, maybe no one would enjoy it anymore.

Really, who would bother tuning 3950 if everyone behaved like gentlemen?

I think maybe I'll run for mayor of Freistatt next year. If I lose, then I can try for Radio Commissioner in two years. Pass an ordinance requiring all Freistatt residents have shortwave radios that tune 3950. Next thing you know, my apartment will burn to zee ground.

cul tnx

good luck slugging it out on 50. have fun. That's what ham radio is supposed to be about. Have a little fun, whatever it takes.

NX0T

Source record: 159726

I can't claim to have a whole lot of experiences with antennas, since this was my first, but by Scantenna seems to work very nicely with my Pro-90 and Pro-60 scanners. It's hard to make meaningful comparisons, but I've been pleased by the 800mhz trunking reception that I've heard, and have no reason to think I'm missing anything on other freq ranges either.

It seems sturdy enough: we've had some nasty windstorms lately that have ripped off live branches from the surrounding trees, but the antenna has suffered no damage so far.

-Bryan

Scott Jenkins wrote in message

Hello,
Just wanted to ask this groups opinion on this Base scanner
Antenna(total length is 46 inches-Pretty big huh???) that ScannerWorld has in their catalog on page 36. Is this antenna any good? Is it any good on the low band(cordless phones) and the "800"(900mhz Cordless phones) band. I'll be using it on a Uniden and Yupiteru handheld. Any comments welcomed.

Thanx

5302. Re: Harris County, TX trunk system has me baffled

Newsgroup: rec.radio.scanner
Date: 1998-05-23 00:00:00 UTC
From: John Habbinga <habbinga@wt.net>
Message-ID: <6k7kor$vm3$1@news4.wt.net>
Source record: 159728

These are the frequencies for the Harris Co. Trunked radio system.

856.2125
856.2375
856.4625
856.4875
856.7125

857.2125
856.2375
856.4625
856.4875
856.7125

858.2125
858.2375
858.4625
858.4875
858.7125

859.2125 * If this frequency contains a data signal, then do not include.
859.2375
859.4625
859.4875
859.7125

860.2125 * If this frequency contains a data signal, then do not include.
860.2375
860.4625
860.4875
860.7125

867.9125
868.2375

Every now and then, Harris Co. will put data on either 859.2125 or 860.2125.
If either of these frequencies contain data, then delete them from the list.
If you leave them in it will make the radio track only a few talkgroups.

I have some Regency TS-2 ,AKA Turbo 800 scanners .
These are out of California Gov. vehicles, like CHP, Sheriff, Caltrans,
ect.
75 Channels, Freq. range 29.94 - 54, 118-135.975 aircraft,
136-174, 406-470,806-950 MHZ.
and preprogrammed NOAA weather including Canadian Freqs.
Units are checked out and in good working order and include copy of
manual and new antenna kit.
$75.00 plus shipping
can e-mail picture if requested

thanks John

Pretty Safe, and I would guess relatively expensive....too much to make
the cost effective. I personally have an el-cheapo, 49Mhz model, and
just remember to turn the damn thing off when I don't need it. (which in
reality isn't often, since I choose to keep an eye on my kids, not let
some piece of electronics try and do it for me)

Sure - people have been putting these beasts in scanners quite a lot, as long as they can accept individual AA cells. The 850 mAH nicad AA cells that Radio Shack sells, and the Panasonic 1100 mAH nicad AA cells that Costco warehouses sell, in particular.

Also, if you are charging the batteries and using the scanner often (every 1-3 days) then NiMH cells are another good option. (They aren't good for charge-and-store because they self-discharge rather quickly). Since owning a digital camera I have come to appreciate NiMH cells more, when used in the correct application. A nicad charging circuit in a scanner will not be optimal for them but should get pretty good results if you let them charge long enough (according to capacity).

We purchased a Fisher Price baby monitor with the Privacy Feature, and it works pretty good. With my Uniden 3000xlt set to 5KHz steps, it's hard to tune into the exact frequency (upper 40's), even with a RH77-CA whip. Also, the privacy feature basicly scrambles the speech - you can hear voices on the scanner, but they're totally unintelligable. There 2^5 different scrambling codes. I feel pretty secure with it.

From: n3taw@aol.com
Message-ID: <1998052301591300.VAA19354@ladder03.news.aol.com>
Source record: 159772

I have a scanner radio that was runing fine using com1 or com2, standard irq,s and adresses with no conflicts. My modem is on com 3 using irq 10 with no problem. I think my problem stems from loading directx 5.0 for games, as it addresses hardware I think it may have changed my rs232 setting. I can send data to the scanner but the scanner cannot send data back. I believe that I once saw some old DOS software that could reset a com port baut dont seem to be able to locate anything now. I am running win 95. Do you have any suggestions for me.

Thank you

Mark (n3taw)

Hi. buzz buzz. A friend of mine has a pro 50 with somewhat of the same problem.
My opinion is to take out the battery pack for at least ten days. Your memory will
be lost and will need to re-program. If your radio is asleep, take a volt-ohm meter
and start at your positive-negative wires on your battery pack and look for a non-
conductive connection. Also on your battery pack, look for a bent connector. Most
of all, check your batteries with a good tester! Also, has your scanner been dropped? If so, you could have a cold solder connection. Please respond. Hope this helps! I have 25+ years in scanning. Good luck.

Hadn't thought about using the existing hole. Either an inexpensive
dual-band ham radio antenna or the Antenna Specialist MON series would work
well. I am currently waiting for the literature from AS to arrive so that
I can pick out one myself. Sorry, I can't be more help to you.

It is not possible to receive 520-760 MHz by any
means for that scanner, other than with an external
converter....and you'd probably have to make one
of those.

As for the 800 MHz freqs, you should have continuous
coverage of 760-1300 MHz once the cell mod is done.

As far as CTCSS goes, you don't need a scanner capable of it unless you only want to limit what you hear on certain frequencies. It does not allow you to hear more. You can recognize some of the higher frequency tones by listening for a faint, low pitched hum in the background. Just about all conventional public service frequencies use CTCSS tones.
SSB is used in the ham bands around 50.125, 144.200, and in the 222 and 432 MHz range just to name a few. These signals are usually pretty weak and require a good antenna to hear. I personally can't think of anymore but I'm sure there is.
As for digital, I've never really got into that so I can't advise.

does any one have a decent solution to getting a little more light out
of the
back light on the pro-2006? i have two of them both with new el panel
lights
in them, one of them is a little brighter than the other and has
always been
that way, it also is the older of the two.

any help? craig

'Wasn't talking about different packs. Higher capacity
batteries of the same voltage and type (ni-cd) will run the
scanner longer, but will take longer to charge. Yes you
could mod the charging circuit to increase the charge rate,
but why not leave it on longer and save yourself the trouble?

DEFENDING FREEDOM! Web Page
http://www.alltel.net/~hamrick

Latest update to my Web page adds two video links to gun stories, law review abstracts from the University Law Review Project with my "Recommended Reading" list from that abstract list.

Moto: Defending Freedom! through the power of knowledge and education. So, no one is able to pool the wool over anyone else's eyes.

Defending Freedom! Web page covers Constitutional law, centering on the Second Amendment right that protects all other rights under the Constitution. I also include news reports on violations of Constitutional rights. And to add the spice of variety I include news reports of piracy on the high seas and other nautical news as well as news from the Amateur Radio and Shortwave Radio Broadcast Bands. I also include Southern Heritage information to fight the anti-Southern bigotry in society.

You will not find any extremist rhetoric at my Web site. It is intended for mainstream society and written in a mainstream style. The entire content of my Web Site should make mainstream society realize the dangers of ever increasing government regulations present to American society.

CASE IN POINT:

Springfield, OR School shooting is symptomatic of a social problem created by the last forty to sixty years of "federal expansion" and growing legislation. American citizens now live under so much law and regulations that is is a lot like living in a house filed with funiture, storage boxes, and accumulated possessions that their is very little room to move around inside the house. Such is life in America today. Give a child a spanking today the parent gets hauled off to jail for child abuse. We tolerate murder scenes in movies and television but yet we are shocked when children imitate such behavior.

Defending Freedom! Web Site presents material to fight back the growth of federalism and return to an American society of "original intent" the Constution intended for us to have.

Enjoy!

Web Author: Don Hamrick

p.s. My occupation is a merchant seaman. I'll be unable to add
further updates until I return from the sea. So, please check back
at least monthly until you see changes. Then check it frequently.

No, the card I saw covered 0.5-1300MHz AM/FM/SSB/CW.

>Maybe one of the other readers remembers
>these?

I have a card of that type, Reveal XL. It has a dozen or so components
on it, the WinRadio card I saw had a lot more, too many for a band II
(88-108MHz FM broadcast band) radio, even if it included the MW band
(535kHz-1605kHz). I also have a card which covers band II, IV & V (the
UHF TV broadcast bands) the RF & IF of which are screened; the FM radio
card is not screened, picks up internal noise but is usable with the
local stations which is all I require of it.

Hi,

>Standard WS 1000 or AX400 or AX 400B
>Does anyone know where I can get some info on this radio?

There are a couple of different versions of this radio out at the
moment:

Standard AX400 = Welz WS-1000 = Commtel 510
Standard AX400B/E = Welz WS-2000

All are made by Murantz in Japan (Standard) and the main difference
between the two version are that the later models have the 800 memory
channels over the 400 and extra search banks.

If I can be forgiven for saying so you will find pictures and some
additional info on our web pages.

All the best for the weekend.
Cheers,

Perhaps. And then perhaps they showed a "model" of
a product that had not yet hit the streets. Or
perhaps they showed a stripped unit....with the
Faraday shield removed to display the components.

> >It wasn't a picture of a new model. It's the *first*

That's three years ago; not "many".

> However this discussion only serves to show that you are clinically
> paranoid. Paranoia is when you accuse other people of being at fault so
> as to assuage your own bad feelings about yourself.

I see. Well, your nescience is the up-front characteristic of this discussion. It's clearly exemplified in your opening post. Whatever of which you accuse me is supposition and extremely subjective; i.e., laughable.

Your nescience is profoundly prima facie.

Right on. There are a number of broadcast band
radios on PC cards, and what I've seen were not
shielded.

There was also a precursor to WiNRADiO that pretended
to cover a lot of the spectrum, but I don't know
anything about it. It came and went before I was ever
aware of it. As I understand it, it may have inspired
the WiNRADiO people to develop theirs.

I really don't know if its ever been challenged in court. When I was a
Sgt. I was assigned to gun registration that was the law and as a
police officer I enforce the laws not make them. I'll see what I can
find out if you want, but let's not get into a long drawn out
discussion on the issue since this is a scanner group and this subject
is a bit off topic.

The only way to get the entire 800mhz portion of the spectrum is
with a European CPU swap. (or entire logis board).
The CPU is around $ 60.00 at Javiation. It is a surface mount
3/4 inch 100 pin IC. Micro-sugry !!!

To All New Scanner Users,
If you are new to the radio monitoring hobby, I have compiled
a FAQ containing a collection of topics which are frequently
asked on the radio newsgroups.

Topics include :
Look Before You Post
Don't Ask What The Best Scanner Is
Picking A Scanner/Receiver
Scanner Glossary
Scanner Model FAQ
Scanner Dealers FAQ
Frequently Asked Frequencies
FCC Frequency Databases
CTCSS & DCS
What's Illegal
Cellular-capable Scanners
Trunked Radio Systems
Co-ax Cable
Receiver Range
Your Scanner On A Plane
Frequency Counters
Magazines & Newsletters
Rechargeable Battery Tips
*Radio Discussion Lists
*Radio Modifications
*Radio Shack On-line Manuals
*Handheld Scanner Antenna Review
*Used Scanner Price Guide
My Web Page

>me virtually EVERY time I let someone borrow something?

Hmmmmm.... shoving too many mA's up the scanner's ying yang sounds improbbable since the scanner will only draw what it needs according to ohm's law. More probabble is your friend use an incorrectly polarized AC adapter? Maybe it was set on the wrong voltage? (too high)? I'd be curious to find out what the exact problem is.

I have had that issue under study for several
years and there are no economical or simple
solutions. Your best bet is to lay in a supply
of those EL panels before Tandy stops supporting
the PRO-2006 in 1999, because there won't be
any more after then.

Meanwhile, I am continuing to work on a solution.

>3. ?

TOTAL cellular restoration IS possible and getting full 25-1300mhz
with NO gaps!! I have watched and read every post about the pro-26
over the past month or so, in hopes of finding some modifications.
But all the sites people listed none of the sites where there, so I
did some looking on my own one day. Just do a good old fashioned
search of pro-26 and wade through all the sites and you would be
surprised what you can find. But that goes for anything you are
looking for just do a search and see what you find.

Ok, first off if you look on http://w5gb.nmsu.edu/kc5kto/mods.html it
will give you a list of scanners and where or not you can modify them
for cell freqs. There aren't to many but if states that the pro-26
can be. Now you want to know how, well I did some more searching and
you go to this site and it will tell you how
http://www.javiation.co.uk/

I hope my digging will help some one out with this info since nobody
else seems to want to help or give this info out. And remember when
all else fails just look for it or search for it yourself.

From: John Habbinga <habbinga@wt.net>
Message-ID: <6kadsh$8ph$1@news4.wt.net>
Source record: 159608

All of those frequencies belong to the East Texas Medical Center in Crocket, Texas. I guess that if you have a tall antenna and live in the north part of Houston, then you might be hearing that. None of those frequencies that you listed appear to be used in Harris county. If you are using a dual conversion scanner it is very likely that what you are hearing is image interference.
I scanned those frequencies, on a RadioShack Pro-90, Sunday evening and heard nothing at all. Of course there may not have been much activity to scan at that time so I cannot say for sure that there is nothing in Houston/Harris county on those frequencies.

A search of the Percon database shows these frequencies for East Texas Medical Center in Crockett, TX. If you live in far north Harris, County and have a tall antenna you can probably hear them. You might also be able to hear them because of tropspheric ducting. I know that for the last week we have had unusual propagation related to some sort of a low pressure system. I have talked to several states on two meter ham radio in the mornings and evenings this week.

>If you own this reciever please tell me what you think of it. Thanks.<

Very well constructed. Excellent receive capabilities in both HF and above 30 MHz. However, absolutely terrible on 800 freqs. Intermod city, big time, and only on 800 MHz. None of my 4 R7000's or R7100's ever did this, using the same antennas and at the same location.

Scans a lot faster than the older 7000 and 7100. Computer control built in. If it wasn't for the 800 MHz problem, I'd say it was Icom's best receiver so far.

Sometimes they will, the Bc9000 is a great scanner and probably will not be affexted too much by another scanner, it is best to keep the radios and more importantly the antennas away from each other as depending on what freq's you have programmed in there they might lock up on each other or interfere.(clickin sounds)

Another way to find out PL/CTCSS tones is to enter the same frequency into the scanner multiple times, each time with a different PL/CTCSS tone and when you hear someone talk, just look at which tone the radio stopped on.

What freq's do you want to listen to?. A radio supply shop should be
able to sell oyu a fender mount two-way radio antenna with bracket and
cable, if you listen to a little bit of everything then go for an all
band antenna, if just 800 mhz then get a 800 mhz whip.

I hadn't looked at Larsen's website lately, just knew it was there. I work out of their catalog . It ain't what it used to be.. but their stuff is still good!

As for "Defined Scanner Antennas", nothing specific. They offer a few dual-band antennas for 150/450 2way and 2m/440 ham that work quite well as scanner antennas.

Any receiver with a LO or two(which is ALL receivers other than toys)
can interfere with other receivers in close proximity which tune to the
LO frequency or its harmonics.

You probably have the best antenna for monitoring 108-137 MHz already on your car. Your car stereo antenna is great for this band. Get a splitter and adapter if you need it and tap into that antenna lead. I have found this works great on VHF and the lower UHF frequencies. It is not very good for 800 MHz reception.

I have noticed a similar thing. I noticed that if I delete 859.2375 I pick up a lot more. If I have 859.2375 in the trunking bank, then I get the same 11504, 208, 11760 that you did and little else. I think the reason there is more than one control channel is because the system is a "Type 2 Hybrid" configuration. This means that a fleet map needs to be programmed into the radio. I don't know what the fleet map is supposed to be. When I figure it out I will email you and let you know. If you find out first let me know!

>Here's what I've noticed. Control channel broadcasts on 859.2375 and
>859.4875. When I use .2375 I only get a few talkgroups (11504, 208,
10000,

> I have an old PRO-2004 that I like to see about hooking up to
>my 486 laptop. Any suggestions as to what kind of hardware and/or
>software to get?

With a Pro-2004, you are limited to basically the CE-232
computer interface. The CE-232 takes a little time to piece together,
but if you follow the directions, you should get it up and running
before too long. Go to
http://ourworld.compuserve.com/homepages/bcheek/ and get some info on
it, or better yet, grab the book "THE ULTIMATE SCANNER" by Bill Cheek.
It will give you some reading and pictures to show you what task is at
hand. It also is a good reference and learning tool for other
adventures. The controlling software for the CE-232 can be downloaded
at Cheek's website noted above.
You can make the OS456 work in a Pro-2004, but it was designed
for the Pro-2005/2006 models. It takes a little elbow grease to get
the combo to work together. Optoelectronics won't be of any help
either since they don't support the Pro-2004/OS456 combo. You will
definately need the service manuals for both the Pro-2004 and
Pro-2006. IMHO, the best software for the OS456/OS535 boards is PROBE.
If you want to just be able to program channels into the
scanner via computer, the PROgramit interface is a nice little option.
It will also allow you to control the scanner with a TV remote control
with an add on module. http://www.qsl.net/ka2pyj/

If your handy with an iron, its a piece of cake to swap the CPUs...
order a CPU from Jav...take the radio apart and have fun!!
Like I said, piece of cake.
By the way, the part of the radio that RS covered with epoxy was
NOT the CPU. They covered the IC so you can't access the pins to do that
welfare filtering cell. mod, BUTthey didn't think people were
smart enough to realize that they could access other parts of the
same trace on the circuit board.

Hi Ray,

Here's a good start:
Ch1 166.375 North (Madison, Canyon, Mammoth, Norris, Tower)
Ch2 166.975 (input to 166.375)
Ch3 165.5875 South (Lake, Fishing Bridge, Old Faithful, Grant Village)
Ch4 164.800 (link repeater, simulcasts ,etc)
Ch5 167.150 Rangers car to car, special ops

Airnet 168.150 (also 122.950 I think)

UHF Link repeaters:
417.375 (links 166.375)
417.475 (links 165.5875)
417.575 (links 164.800)

Email me if you want other freqs such as:
Grand Teton National Park
TW Services, (provides many services in Park)
Montana Power & Light
West Yellowstone Police & Fire
Island Park, Idaho, etc.
and others in the area of interest.

I'll be there June 15th for a few weeks, I would be happy to
meet you to share my complete list which I've gathered over the
last 15 years.

Happy scanning!

Jon

I ordered (and got) a manual for a PRO-2035 less than 3 weeks ago.
I really would hate to see them doing this, as you could possibly force
them to refund your purchase price or fix a scanner free if it breaks. Since
they readily supplied service information for 30 years the expectation in
buying their product would be that a manual would be available. After 5 years
or so, they are in a different boat but witholding manuals on current equipment
at this point would also be seen as forcing you to have product serviced by
them. Legal types may have a different take, but I'd think the last thing RS
would want is a lawsuit or big publicity from Ralph Nader or some other
consumer advocate.
It wouldn't be too hard to write some letters & at least force them to
make an official anouncement & put disclaimers in the stores if this is
official policy.
Any other reports of refusals out there?

POC32 works through the soundcard, not the comport. It works fine for me when I feed the sound card with the signal from the discriminator tap and plug the other end of the line into the mic in socket on the soundcard. You may need to adjust the volume using the soundcard settings to get a proper readout.

I have a Pro-64 and would like to try some of these decoding programs. I've tried through the headphone jack to the sound card and, as I've seen suggested, There must be some filters before signal gets to the out jack.

What is this discriminator tap and do I have one? If not, can I make one or buy one? How would it hook up to my scanner?

Thanks for any help,

Darin Decker

John Habbinga wrote in message <6k7kor$vm3$1@news4.wt.net>...
>These are the frequencies for the Harris Co. Trunked radio system.
>[frequencies snipped]
>Every now and then, Harris Co. will put data on either 859.2125 or
860.2125.
>If either of these frequencies contain data, then delete them from the
list.
>If you leave them in it will make the radio track only a few talkgroups.

Here's what I've noticed. Control channel broadcasts on 859.2375 and 859.4875. When I use .2375 I only get a few talkgroups (11504, 208, 10000, 11760 and a few others). Using .4875 as the control channel I get a lot more talkgroups but so far haven't got any of the ones listed above.

I've also seen consistent data (non-control but some other kind of data, maybe mdt) on 856, 857 and 858 all at .4625.

What gets even weirder is that no two people on the net seem to agree on which of the 866-868 frequencies should be included. I've heard voice on 868.4875, 867.5375, 867.9125 and 868.4875. I've also heard a control channel on 868.9500 and intermittently on 868.9750.

Also, when I program in the second set of 26 frequencies using 868.9500 as the control channel I get traffic very similary to the 856-860 when using 859.2375 as the control channel. Some of the same talkgroups and it sounds like the same people. I haven't listened long enough to figure out what is going on.

How did you determine that 867.9125 and 868.2375 should be added to the 856-860 trunk?

Thans for your help in trying to de-baffle me!

-Linda

I found those frequencies listed at www.installer.com. I tried them and they do seem to be a part of the system.
I use all the frequencies that I gave you and I have a lot of traffic. Especially during the day when other agencies, such as animal control, flood district, etc are working. I have noticed that on the RadioShack Pro-90 that when left on for several days it may lose track of the control signal. If it does I can corrected it by turning the scanner off and back on. I think that Bill Gates taught scanner manufactures how to do this. I posted the frequencies for the Harris County system and the Trunktracker talkgroup codes for just the Sheriff's Department at http://members.aol.com/jdhtex/houstonscan/harrisco.htm.

I picked up an Auto Pod V converter at a flea market and it had no diagrams
or manual with it.

It has the following wires :
green #12
black #12
white #12
yellow #18
red #18
brown #18
grey #18
this is supposed to be hooked to the alternator

I need to know where these wires are to be hooked up

any help will be appreciated

Turp

The best thing to do probably is just to order the service manual from Radio Shack. I don't know what the best thing for you to do since you are in the Netherlands. Go to http://support.tandy.com/support_electronics/doc30/30401.htm for the parts listings for the Pro-43. The Service Manual has the NP# of MS2000300. You can normally call 1-800-843-7422 or 1-800-THE-SHACK for parts here in the states. You might try contacting them by e-mail and see what your options are for overseas. support@tandy.com

Source record: 159699

Unless you are at or near the track, you can't listen to the teams radio communications over your scanner. The radios they use have relatively little range and don't get far beyond the confines of the race track.

If you want to listen to CART and NASCAR teams from home, you can do it over your computer at www.fanscanonline.com. You'll need a sound card and realaudio software. There's a couple of second lag on the internet that will vary based on your ISP and your distance from the server.

Message-ID: <6k89n9$6m2$1@nnrp1.dejanews.com>
Source record: 159739

Hello all. I just did the mod on my 855xlt that opens up cellular and increases channels to 100. Works great except for when I shut off the radio and turn it back on I get no display. I have to disconnect power from the unit to reset it. Anybody with this radio experience this after doing the mod? I used a 10k resistor just like the mod instructions said. Thanks in advance.

5434. Excessive Radio Use Raises Safety Concerns

Newsgroup: rec.radio.scanner
Date: 1998-05-24 00:00:00 UTC
From: No_Mail@No_Site.ca
Message-ID: <g1O91.2163$bh7.2421373@news21.bellglobal.com>
Source record: 159741
Cross-posted to: rec.radio.scanner,misc.transport.trucking

I recently came across the following article in the SPRING 1998 issue of _Forest_Products_Carrier_ magazine "The official magazine of the Northwestern Ontario Log Transportation Association". The frequencies spoken of in the article are 170.310 and 171.000 MHz, however I'm not sure which one is channel "5" or "6". These frequencies are in use in the Canadian province of Ontario from Lake Superior west to the province of Manitoba. I'm not sure how these frequencies are allocated in other areas of Canada.

Since these channels were issued, I have noticed a significant increase in the numbers of other frequencies allocated to private trucking in the area. The allocations seem to congregate around the high 160 MHz areas and the 170s. Frankly, I can't stand listening to 5 and 6 for the specific reasons outlined in the article. I keep them in my scanner, but they're always locked out unless their is a forest fire or the weather is bad.

Excessive Radio Use Raises Safety Concerns.
by Edward James

What was once a valuable safety tool for log haulers is turning into an excessively used chat line that is creating a disaster waiting to happen. In the mid-'80s, log haulers petitioned the government for two radio channels (5 and 6) that they could use to report the location of their trucks on haul roads. This permitted truckers to be aware of other haulers using the road, enabling them to coordinate meeting oncoming traffic on safe stretches of road, places where there were no sharp curves, soft spots or narrow sections. Drivers quickly realized the safety benefits of the radio; even contractors who first balked at the expense of outfitting all their vehicles with radios soon saw the safety benefit and purchased radios for their drivers.

Today, virtually everyone who drives on these roads, works in the bush or has a camp/cottage in the area is also equipped with a radio. More often than not they are tuned to channel 5 or 6 where they idly gossip or discuss the latest news. Truckers attempting to report their position for safety reasons are often unable to do so due to excessive chitchat.

Trucking safety committees and even the forestry companies are raising the excessive idle chatter issue with their drivers and contractors. The situation is totally out of control, report haulers from Kenora, Fort Frances, Thunder Bay and virtually everywhere else

in Northwestern Ontario. Safety is being compromised!

There are several issues which compound the excessive use problem, points out Kenora area log hauler Don Mills who pushed for the two channels many years ago when he was the origional chairman of the Kenora Area Truckers Safety Association. The first is the range of the radios which can easily broadcast 20km and up to 70 in good weather or when the operator is at a high point of ground. This range allows overlapping from workers on parallel haul roads that may be several kilometers away. Compounding the problem even more is the fact that virtually every skidder, forwarder, gravel truck, bulldozer and pickup driver working in the bush has a radio tuned to channel 5 or 6 and they constantly use it for business communication or chatting.

"We have 90 haulers using the English River Road so you can imagine that the radio gets pretty busy at times with everyone calling in their location," says Mills. "Include the other bush workers and the radio use is virtually non-stop."

The real congestion problem arises when the truckers and bush contractors use the haul channels for talking back and forth, agree Mills and hauler/contractors in Fort Frances and Thunder Bay. They also agree that a partial solution to the problem is for the contractors in the bush to get their own channel.

"We encourage contractors to get a separate channel for their private use," reports NOLTA Vice-President Gary Robbins of Buchanan Forest Products in Thunder Bay. "Some even have their own channel, but for some reason still use the hauling channels for talking back and forth to each other."

Rainy River District Logging & Safety Committee Chairman Les Christian of LCB Logging in Fort Frances obtained his own radio channel years ago because of the excessive channel 5 and 6 chatter. "You can't do witout a radio and most big operators even have their own channel. We use our channel in the bush operation, but switch to 5 or 6 when hauling. Even with our own channel, everyone wants to at least listen to 5 and 6 to hear what is going on."

Hearing "what is going on" is more often than not merely listening to gossip. Some of the conversation is more appropriate for daytime television talk shows than a truckers' hauling channel dedicated to reporting bush road locations for safety reasons.

Because channels 5 and 6 are OPEN, there is no one responsible for them or to monitor their use. It is therefore up to everyone to act appropriately. Suggestions for use of channels 5 and 6 include:

* Use them only to report your position on bush roads.

* Don't rely on the radio to inform you about all the traffic on the road (i.e. drive to the road, not the radio).

* When hauling the highways, use your CB for conversations, not the radio haul channels.

* Peer group monitoring - let your co-workers know if they are over-using the radio.

* Be considerate of others, channels 5 and 6 are for everyone's use and should not be used for excessive private conversations.

5435. Re: icom pcr 1000 or winradio??

Newsgroup: rec.radio.scanner
Date: 1998-05-24 00:00:00 UTC
From: Jeffrey Miller <jfmil@earthlink.net>
Message-ID: <3567C5A0.B222877F@earthlink.net>
Source record: 159742
Cross-posted to: rec.radio.scanner,alt.radio.scanner

As I said I didn't know anything about winradio except that it required a Desktop PC and its posted frequency range. Though if the person wanted to they could program the frequencies of the PD etc for their destination (assuming they aren't driving or if driving didn't care about "along the way communities" and not wanting more than 1 bank of channels to be scanned since that seems to be a weakness of a non pc controlled 1000) As I said I don't have either. Though my radio choice was a tossup between 3 High end hand helds - I chose the R10 for the simple reason of money.

QUESTIONS -- 1 which would you rather have stolen a $500 Scanner or a 2000 dollar laptop PC (approximate average price) or worst case both?
Personally I'd rather have the scanner stolen.
2) Is the PCMCIA Winradio available if not the fact
the radio debuted would be irrelevant if the trip is in the near future

Best magmount is a Larsen (www.larsenet.com) with the NMO mount. They cover about any freg range you want in the NMO series antennas.

DC adapter? Probably a RadShack universal

As for the bracket, no ideas, You might find some "universal" type at a CB shop.

No, it's only a possibility. And then, only as I described
it; not as you flatulated.

> >Or
> >perhaps they showed a stripped unit....with the
> >Faraday shield removed to display the components.
>
> As I said in a previous post, no obvious place for it to be mounted.

That's why I suggested it was not a WiNRADiO.
WR's shielding is obvious.

> >> Please see the May 1996 issue of RadCom

> >That's three years ago; not "many".

> A figure of speech,

Aaaaaahhh, now we talk in figures of speech in lieu of
accuracy and exactness. That's the basis on which you
disseminate your FUD.

> but the point is not that it was many or a few but
> that it was advertised and exhibited then.

We have not established that you saw an unshielded,
unfiltered WiNRADiO. You only saw *something* and
came on here to spew that WiNRADiO was unshielded
and unfiltered.....a blatant inaccuracy at best.

> Is it possible that Rosetta Laboratories were showing this in the UK as
> the WinRadio between first announcement of the product and production
> quantities shipping to the USA?

I don't know. But it is most unlikely that they would
show an obviously inferior product, unless it were
stripped down for maximal visibility of the board and
component layout....in which case it would be much more

a model and less a radio.

> On the Winradio web site I read that
> WinRadio Pty was established to manufacture and develop this product in
> August 96, in May 96 the product was described as manufactured by the
> WinRadio division of Rosetta Laboratories GmbH. Could the product I saw
> have been this precursor, manufactured by the same people and quietly
> changed after a few months?

Maybe. But doubtful. Again, it's more likely that you
saw a stripped model....not a shipping unit. Perhaps it
could have been a prototype where the shielding would
have gotten in the way of trial and error circuit
evolution. Perhaps a lot of things.

But no "perhaps" about it that you described WiNRADiO
totally inaccurately. Whatever you saw two years ago
is not the product that shipped two years ago, much
less today! I don't know what you saw, but you did not
see a WiNRADiO in any semblance of a market product.
Or if you did, (unlikely), it was not a product that
ever hit the USA market.

You did attempt to spew inaccurate and untruthful
characteristics of the current WiNRADiO. That is a
prima facie fact. Everything else is supposition and
conjecture. What you DID do was way off base, regardless
of the possibilities and so-called justifications.

Nescient at best; untruthful at worst.

> It is not unusual for manufactures to supply reviewers with pre-
> production samples for photographic and feature review. They do however
> usually state this and require that it is not used for a technical
> performance review.

I know. I am a manufacturer and a reviewer. And I know
I would never offer a product for review or public scrutiny
as you claim to have seen. No manufacturer in their right
mind would. That's why at first I allowed that you might
have been mistaken or confused....or the vendor, deceptive.

(But by the gods, you COULDN'T have been mistaken!)

Your continued defense of a moot and/or provably inaccurate
statement makes me wonder if it weren't intentionally
deceptive and calculated to be a packet of FUD.

In fact, I could almost bet the farm that you are a long
time user of OS/2..... Now how could I guess that?

> with NO gaps!!

It isn't within the realm of possibility for the majority
of PRO-26 owners, and even for those where it is possible,
the results are far less than optimal....actually downright
disappointing, not to mention COSTLY.

In a world where there are "doable" possibilities and far-out
possibilities, the one of which you speak is the latter. So
we're really talking a play on words much more so than anything
that can help the overwhelming majority of PRO-26 owners.

You tell me, for example, how the PRO-26 owner can
replace that PRO-26 CPU? Do the audience a favor and
tell 'em HOW, please.

Good or not, they're illegal to import into
the USA. And there is no service and support
for them. Just TRY to get a service manual,
ferinstance.

Worth a thought before sending out that hard
cold cash to Europe.....notably to a manufacturer
that doesn't care enough to get its products
certified for sale in the USA.

A simple question, were you at the Pickets Lock (London UK, just in case
there's another one) exhibition in 1996?
If not then you can not know what was there.

------------ cut -------------

>Whatever you saw two years ago
>is not the product that shipped two years ago, much

Agreed that a lack of screening and filtering would make it unfit to be
marketed, but it would not prevent it being marketed.

>Or if you did, (unlikely), it was not a product that
>ever hit the USA market.

You will hear all sorts of opinions as brand name loyalty is very
strong especially with Icom users, which has been the cause of some
heated arguments on this NG. I prefer to listen to no-one and simply
try the units out myself. In my case I finished up buying both WR1000i
and PCR1000, and they perform as specified. Winradio software is
definitely better. I plan to buy the new WR1500 as previewed at Dayton
Hamvention (we might have bumped into each other there). Icom was not
showing any new PC products and I was told they are not planning any
until at least the end of 1999.

Well if you like to "poke" around with a DVM you can find the line from the CPU chip to the audio amp chip. Look for an increase in voltage when you press a key. Now cut the trace or find a resistor on the PCB trace & remove it.

I believe this is not quite correct. Both WR external models support
serial as standard, PCMCIA as a separate option which you can purchase
later. (I.e. you don't need a special model to get PCMCIA.)

>That'd be the 1000e (External) and the 1500i and 1500e. Both looked similar,
>yet the fellow said basically the 1500 was slightly more expensive and was an

1500 has frequency range to 1500 MHz and 1Hz SSB tuning

>Charles
>
>BTW: The cases between the Icom and the 1000e/1500e look similar, just
>finished in different colors. The WinRadio was gray and the Icom was black.

That's what I saw also. Icom is made of folded sheet metal, Winradio
is made of powder-coated aluminium extrusion (a more expensive,
corrosion-proof and better looking solution - just my personal
opinion).

Message-ID: <1998052521180900.RAA24591@ladder01.news.aol.com>
Source record: 159509

In article <6k7kor$vm3$1@news4.wt.net>, "John Habbinga" <habbinga(remove this)@wt.net> writes:

>Every now and then, Harris Co. will put data on either 859.2125 or 860.2125.
>If either of these frequencies contain data, then delete them from the list.
>If you leave them in it will make the radio track only a few talkgroups.
>

Now I'm really confused. I usually listen to Harris County SO and Pct 4 Constable but I have found I can't listen to both at the same time. I bought a second TT and found that if I leave 859.2375 out of one and 859.7125 out of the other I can listen to both. This only works about 60% of the time. The other 40% I can either hear both on one radio or neither.

I also have that booklet, and looked this up--
That booklet lists 4 groups for Harris county, with some of the
frequencies appearing in more than one group. How do you suggest
programming them? And which is S.O. vs. some other county usage?

Same question for the Pasadena frequencies. The PD is not noted in
their two sets either.

5455. Looking for Michigan airport frequencies.

> I can't find the key sequence to reset the CPU of my BC-200XLT. Does anyone
> know it off the top of their head?
>
Try, with the radio off..hold down Manual--2--9--and turn the radio on,
this will erase all programmed entries.

If you want to reload the factory pre-programmed frequencies, again
with the radio off try,
Scan--2--9 and turn the radio on.

Let me know if this works OK.

5457. Re: BC-200XLT reset?

I dunno....but yes, it was a typo. Should have
read "1996".

Soooo......now that this is clarified and rectified,
we are back on track, are we not?

Fact is, I began journalistic coverage of WiNRADiO in
July, 1996. My review model was dated months earlier.
You claim to have seen an unshielded, non-filtered
WiNRADiO in May, 1996.

How can this be? Unless you were mistaken......

I think the solution to the problems associated with scanning Harris Co. system are due to the fact that it is a "Type 2 Hybrid" system and needs to have a custom fleetmap programmed into it. I can't seem to get any better results from the preprogrammed fleetmaps. As soon as someone figures out the correct fleetmap, please let me know.

5462. Pro-43 Leather Case

OK, How about clarifying "The Law"? Is it illegal to own a cell capable scanner, or is it illegal to *use* it? Is it illegal to own a cell modified pro-2006, or to use it? Is it legal to modify a scanner to make it cell capable? Is it illegal to publish *how-to* ifo. on modifying scanners to make them cell capable?

Southwest Frequency Directory has just completed a new Nevada Edition. It covers the Las Vegas & Laughlin
(Clark County) areas. The book is over 60 pages, and includes frequencies, channel numbers & uses, PL tones,
fire station locations and apparatus designators, radio codes, trunktracker talkgroups for casino 800 MHz
systems, Metro PD District maps, general agency information and more. Also includes frequencies for
railroads, aircraft, recreation, schools, utilities, etc. Sells for $18 shipped directly from Southwest
Frequency Directory. Also available in Vegas at Fox's Spy Outlet. E-mail DanR@azstarnet.com for ordering
info.

Thanks,

Dan Rollman

I'm not sure what you mean by this, but my guess is that you're referring to the voltage levels provided by the outboard "bit-banger" decoder interface.

I've seen some motherboards that couldn't deal with the voltage levels and/or available drive current. It happens with hardware that uses the MAXIM 5V to RS-232 level converters as well.

For the POCSAG decoders, the problem is that there isn't enough current available on the RS-232 output lines to drive the input RS-232 line.

One such board is the Tyan Tomcat III (S1563). For some strange reason it has a 10K pullup resistor on the RS-232 input. In my case (to deal with an Innoventions compuer-controlled SIMM tester) I just unsoldered the resistor from the motherboard (a warranty-voiding modification).

It should be possible to build an outboard converter (albeit with the inconvenience of an external power supply). You'd need a supply that produces anything between +5/-5 and +15/-15, though +5/-5 is best as you can use the +5 to power the 1489 RS-232 receiver. Use a 1489 RS-232 receiver and a 1488 RS-232 driver (in the obvious configuration), powering the 1488 from your double-ended supply.

For the POCSAG bit-banger decoders you could presumably just power the whole decoder from a +12/-12 supply and skip the 1488/1489, though I don't know offhand if the 741 op amp can supply enough drive current to get past the pullup resistor on the motherboard.

One word of caution - if you have a "smart" decoder like the one from Cylex, it depends on the toggling of the RS-232 lines it uses for power to receive a reset/wake-up signal, and won't always work properly if powered from an outboard supply.

5478. Re: Harris County, TX trunk system has me baffled

Newsgroup: rec.radio.scanner
Date: 1998-05-25 00:00:00 UTC
From: Leo Waltz <Leo.Waltz@prodigy.net>
Message-ID: <3569532F.6A3CA58C@prodigy.net>
Source record: 159565

The ".9875" frequencies are strong on my BC235 in the SE portion of Harris county (using factory antenna), and the conversations talk about auto accidents near airport, traffic on Hwy. 3, units being out at the jail, District 1, District 4, etc.

The data/control channel has been shifted to 860 from 858 since yesterday, and 860 now has more voice traffic. It has the low pitch (using stereo headphones) audio shutoff similar to the other Harris county trunk channels.

I originally got those frequencies from a posted list for Harris county, and they also show among the San Antonio City/Bexar County system frequencies, and 6 other Texas cities besides the Tyler listing you have.

In fact, I think I have just this minute found the answer by looking up the frequencies (in Police Call-1998)-- one of those 7 Texas cities for those frequencies is League City, which also has Pasadena traffic on their trunking system.

This will take some more monitoring to ascertain just who is using the frequencies.

>else with a 2045 experiencing the same thing????

yup. I have 2045 and receives cellulars in cordless phone + amateur
range (902 - 928). Since it is a triple conversion scanner, I don't
get as good signals as pro 26 image.

>This radio has all the toys compared to my Pro 2022 and 200xlt,is it

>triple conversion has something to do with this,Not sure what triple
>conversin is!!!
>The calls come in one after the other,non stop!!! Any input greatly
>appreciated!!!

yup... you don't need any mod to receive cellulars on 2045. The
signals what you hear is generally weaker than pro26 image.

Although the other two that have replied have both been half right,
the actuall company now depends on what kind of equipment you
have.

Wilson was purchased by Regency.

Regency sold their scanners to Uniden, then changed their name to
RELM, which stood for Regency Electronic Land Mobile.

So, if some of it is old scanners, go to Uniden, if some is old
two way, go to RELM. Good luck, most of that stuff is so old
that it is no longer supported.

I have heard of that before, usually when the radio is first turned on. Several people complained of the problem when the Pro26 first came out. It sound like some type of bug in the firmware. If you turn the scanner off than back on does it correct the problem?

What circuit did you build? There are several
variations, some better than others, depending....

What scanner? Is the Discriminator Tap done
properly? What is the output AC volts of this
tap? If it's under 400-mV AC, you might have to
try a different version of the Decoder Interface.

I have heard if you double the (IF) Intermediate Frequency that a scanner uses and add that number to the real frequency you can pick up the signal. Every Scanner uses a slightly different number.

With my old BC200XLT scanner, when in the 800 or 900 Mhz range, I can add 21.7 to the real frequency and pick up the signal at that frequency also, sometimes better than on the real frequency. So if we take 878.187 - 21.7 = 856.487 Mhz.

Good chance it is your monitor not your computer. Generally the
computer is in a shielded metal case. The monitor is not. Same goes
with the keyboard. Unplug your monitor and see if the noise goes
away. Next I'd check the keyboard. Try and improve the ground.

Where is your antenna? Move it away from the computer. IF it is and
you don't hear the noise with out the antenna then replace the cable
for the antenna with a better shielded one.

Hope this helps.

Mike,

> people have been putting these beasts in scanners quite a lot, as
> long as they can accept individual AA cells

That's just the problem. The Uniden BP-205 is a complete unit that is basically a plastic box configured to look like the bottom half of my BC100XLT scanner which contains both the charging/limiting circuit and six AA nicad batteries all shrinkwrapped together in a bundle two rows of three batteries each. Impossible to bring this back out each time and charge individually after discharge.

Thanks!

Charles

As this is a radio-scanner newsgroup, I doubt this machine will be
of much use. I don't see how they can make a machine that can detect
a passive radio monitoring cell or cordless phones. Ok, if you are
a drug dealer, or mobster you may be concerned about law enforcement
agencies listening in. But IMHO anyone who is using phones to discuss
sensitive matters normally use a secured line.

5494. Re: What's a Hwy Patrol Mobile Extender?

Newsgroup: rec.radio.scanner
Date: 1998-05-25 00:00:00 UTC
From: gmacdoug1@aol.com
Message-ID: <19980525162644400.MAA19249@ladder03.news.aol.com>
Source record: 159581

>The CHP mobile extender is 154.905, is there anyother freq. that they use?

The extender circuit is activated either manually by the officer pushing a button when exiting the patrol car or by "kerchunking" the portable twice on channel 1.

Channels 1 through 3 use 154.905 MHz. Ch 1 CTSS tone will activate the patrol car's 42 MHz car-to-base frequency. Ch2 CTSS tone will activate the 42 MHz car-to-car frequency. Ch3 is 154.905 MHz only with no CTSS, for portable to portable communication. Ch4 is no CTSS CLEMARS frequncy, 154.920 MHz.

Hope this helps.

You cannot "restore" what was never there in the
first place. Scanners made in the USA or imported
after March, 1994, are not capable of cellular
"restoration". Cellular isn't blocked in these
radios - it just isn't there, period.

You can thank our Congress and the TDDRA of 1994
for that.

5497. Using An Outdoor Antenna On A Portable?

Newsgroup: rec.radio.scanner
Date: 1998-05-25 00:00:00 UTC
From: Robert Snelgrove <steelgtr@ix.netcom.com>
Message-ID: <6kc822$kqa@sjx-ixn9.ix.netcom.com>
Source record: 159584
Cross-posted to: alt.radio.scanner,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.scanner

Hi,
Another newbie question. If I got a portable (leaning towards the Yupi 7100), Will an outdoor antenna always have benefits only, or can it "overpower" the reciever? I'm thinking for now any of the Radio Shack antennas like the discone or the smaller ones.

Thanks!

Bob

> >Haven't you followed the thread? Yupiteru
> >radios are illegal to import into the USA.

> I followed the thread. The questions asked if the scanner was *good*

Yes, it did ask that.... and illegal is not "good".

> and how the audio was. I took these questions to be asking in essence
> if the scanner performance was *good*.

Right. It's illegal. That's not "good".

> I didn't educe from Mr.Snelgrove's questions that he was
> asking if the unit was legal for import into the US of if
> anyone cared where he was sending his money.

So? That's YOU. Who cares what you didn't "educe"?
I don't care, anyway. Besides, there wasn't a post
on the thread from you for me to consider the value
of your deductions. <shrug> And my response wasn't
designed to entertain you....

> The fact that the scanner doesn't meet the criteria in specifications
> to be a legal import in my humble opinion couldn't have anything less
> to do with where I felt Mr. Snelgrove's questions were going.

Nevertheless, he needed to know something, and whatever
you "felt" was totally not relevant to the thread. So
stick your mitts back into your pockets and "feel" some more,
for all I care.

> Suggestion Bill, please limit your responses in this news group to
> ones that deal directly with scanners.

Pardon me, but I don't follow "suggestions". And in any
event, my response was DIRECTLY related to scanners.
```

> I for one really could do without your personal editorials.

SO? Don't read them. Is anyone twisting your arm?
I'm not. Hell, I am INVITING you to not read what I post.
I'm begging you to not read my posts. You can control
your own computer, can you not?

> It is none of your business what anyone does with their money

Right. So long as they know the facts..... If they
don't know all the facts, then it is my business to
at least add to their inventory of facts before they
make the decision.....and have to live with the consequences.

> other than maybe to try to dissuade
> someone from buying a scanner that was blatantly inferior in design
> and performance..

Or........ILLEGAL? Isn't "illegal" an important
consideration? Maybe it is to the guy I replied to?
If not to you, oh well. Tough.

> I don't know what motivates you to reply in the
> manner you do nor do I really give a hoot,

Now there's an oxymoron if I ever saw one. Obviously
you do give a hoot. You are very entertaining now.
And it's FREE entertainment, no less! Are you a
professional comedian, by any chance?

> but you seem to be very impulsive with your replies.

Well, don't read them, then. Simple, no?

> Almost like you claim a certain virtual ownership of this
> news group

Bingo! Right on! I certainly DO *own* the part of
the newsgroup that appears on my screen and is stored
on my hard disk drive.

And guess what? I will do with that part of it as
suits me without ANY consideration for what doesn't
suit you. You have your screen and hard disk, and
you are free to do with those as suits you. So do
something with them and don't make your sniveling
little problems mine. I don't want them.

> and you can do or say no wrong

If YOU say so....... :-)

> and you expect everyone reading to take your point of
> view as the infallable and ultimate truth.

No shit? I said that? Where? Show me!
Get up off your lazy fat arse and show me
where I said or inferred anything such!

> I would hate to have to once again add the kill filter expression

So buy one then. Who cares? I don't.

> I don't think that the few US citizens that are willing to
> risk $300+ on an illegal import scanner are going to help line
> any fat cat's bank accounts.

Have you ever considered hiring someone to do your
thinking for you? Can't you do the math? $300 x 100 = $30k.
That's a nice bank account. x1000 is an even nicer
bank account. x10000 is a superb bank account.

> I DO NOT advise anyone to violate any US laws regarding the
> acquisition and ownership of radio gear that does not conform to said
> laws. But I do feel that this should be their decision and not yours
> or mine.

If you reread my post, you will see where I said the
same damned thing is a lot fewer words. Read it.

Or can't you comprehend fewer words?

Looks to me like you read a LOT of what WASN'T there, Slick!
How do you do that? That's a neat trick. Teach me how.

Mark,

• What freq's do you want to listen to?.

Mostly PD dispatch. I don't have a trunk tracker yet, our PD is still non-trunked, but its purchase is in the works.

Thanks!

Charles

Hi
I have taken my hand held scanner to Spain for the last 5yrs and last week
to Majorca. I kept it in my hand luggage at the airports and have never been
challenged yet.
Airports use English except for local flights but otherwise its Spanish ony,
Use it with discretion just in case!

The sheer, unmitigated gall that pervades your
post stimulates me to quote my own reply to the
gentleman's question, in order to to underscore
the utter idiocy of your response:

BC> Good or not, they're illegal to import into
BC> the USA. And there is no service and support
BC> for them. Just TRY to get a service manual,
BC> ferinstance.
BC>
BC> Worth a thought before sending out that hard
BC> cold cash to Europe.....notably to a manufacturer
BC> that doesn't care enough to get its products
BC> certified for sale in the USA.

If you had so little as a sphincter for an eyesocket,
you could see that I was talking about nothing BUT
scanners.

How could you, even in a drug-induced haze, or in
the fog of profound Mongoloidism, interpret what I
said to be about anything BUT scanners? Were you
in full possession of your cranial container ALL
day, today? Or did you let it out for a walk?

You are, therefore, cordially invited to pack a
5-gallon bucket of sand into that cavernous orifice
of yours where the sun never shines.

Sheesh, some people's kids, Herr Doktor Slick!

That is not correct in all cases.
Until the ban sometime in 97, the AOR 8000s which
were legally sold in the US, could have cellular
range restored via software alone ....
All you had to do was run a program that altered the
bandplan.

If you have a 300-watt pager transmitter down the
street from you, sure....an external antenna could
pipe in enough signal to overload the front end
and cause all sorts of havoc and consternation.

Much depends on the quality of the design of the
receiver, though. Some are susceptible to overload
and some are not. I don't know about the Yupiteru
and no one else does, either, because technical
data, including schematics, aren't available.

You have to go on someone's word....a most suspicious
aspect, really. And, of course, the Yupiteru radios
are illegal to import into the USA. This is said as
a matter of fact, just so's you know.

Back years ago, people brought in illegal "export"
CB radios by the droves. With impunity. Then all
of a sudden the FCC and US Customs cracked down and
people's heads rolled all over the place.

Something to keep in mind when opening and wantonly
discussing illegal contraband in these open, public
newsgroups where the gendarmes can read, same as you
and me. If you are going to do something, just do
it....but to talk about illegal activities in an
open forum isn't one of the best of your options.

IMHO.

Does anyone have any freq's in the suburban area of
Chicago that are of interest? Local police are a bit boring
catching speeders.

5510. ICOM R10 (Icom R-10) wanted, windows software compared to dos software & comments about cloning.

Newsgroup: rec.radio.scanner
Date: 1998-05-25 00:00:00 UTC
From: airplane@bna.org
Message-ID: <6kcfhk$asq@bgtnsc03.worldnet.att.net>
Source record: 159597

Has anyone got the new windows software for the R10 yet? I saw
it for sale in the AES catalog, www.aesham.com and I am curious what
new features it might have, if there's anyone who has tried it yet.

I have the R10 and the associated dos sotware. I've found the dos
version is written inefficiently and will not run on XT or Palmtop
machines. However if you push the shift key in clone mode, you can
download the data from the radio (use ascii hex mode) and send it back
in, using 19200 baud. Any palmtop, XT, or AT bus PC can be used.
To reload the data to the radio just go to clone mode and upload
binary text. I used procomm plus raw ascii modes 19.2 and on an
HP 200 LX palmtop, I used its built in comm program.

Important: Use the ct17 intrerface.
Note on radio to radio cloning: There is no pull up on the clone port
on the side of the R10, but there is on the sleeve of the top AF out
connector. So to direct clone you either need anothe radio for 5v
pull up, or cross connect sleeve on top to side port, or just plug
into the ct17. Thats why the Icom clone cable has tip to sleeve
crossover.
Let me know if you've got that software, I am thinking of upgrading
from the dos version.

I did some tests on the R10 input and found it seems to have a
varactor preselector that works on all bands from 30-650 MHz then
seems to switch to high pass in 650-1300 band. Thats too bad because
it desenses badly when you are in the killer 1/2 mile zone under a
cell tower. (noticable if you are trying to listen to weak signals
that go away with attenuator turned on). Yet does fine near FMBC bands
and seems to reject vhf pagers well too, unless you tune close to
them.
Also, the attenuation level is about 16dB on this unit.
I made an excel spreadsheet of the R10 input returnloss when tuned
various places, respond if you want to see it.

Example, 903MHz cordless gets chopped out but may pop back in with
attenuator *on* or if you lean the antenna horizontal. The wide band
noise from a cell tower reaches -30dbm per carrier x 32-64 carriers
and none of the towers here uses sector transmit or any kind of
transmit power control. This is available from motorola, they are too
cheap to implement the sector transmit antennas and transmit modules.
In fact you will tend to see both cell companies close to each others
towers because A sys will desense B sys if one of them is close and
the other is far. Ha try to get them to change from 100watt erp!

Let me just say you dont want to live under one of these towers because the downtilt makes max power land in the zone .5 to 1 mile out from the towers. Dont ever gripe about crumby signals on your cellphone, if you can get them to fade its the uplink not the downlink.

Battery life:
Battery save will only operate on single channel non scan non priority, and you see a 50mA drain with pulsing to 180ma in this mode. If scanning it hangs out around 180, and peaks to 225ma if you are recieving a signal with lights on.

I tested 2 of these and they wont clone non cell to cell without both being non cell blocked.

From: Linda Thomas <Linda.Thomas@dialaccess.com>
Message-ID: <3569c31e.0@news8.kcdata.com>
Source record: 159603

John Habbinga wrote in message <6kataugtk1@news4.wt.net>...
>I have noticed a similar thing. I noticed that if I delete 859.2375 I pick
>up a lot more. If I have 859.2375 in the trunking bank, then I get the same
>11504, 208, 11760 that you did and little else. I think the reason there is
>more than one control channel is because the system is a "Type 2 Hybrid"
>configuration. This means that a fleet map needs to be programmed into the
>radio.

I did some investigating last night and here's what I've noticed:

856.2125, 856.4875, 857.2125, 858.2125, 858.4875, 859.4625, 859.7125,
860.2325, 860.4875, 860.7125 and 867.9125 seem to comprise one system.
Currently 860.7125 is the control channel.

856.2375, 857.2375, 858.2375, 859.2375, 860.2125 and 868.4875 see to
comprise another smaller system. Currently 859.2375 is the control channel.
I, coincidentally just got an email from Steve Casko that duplicates this
set of frequencies.

Lastly, 866.5255, 867.5375 and 868.95 seem to make up another one.

I left out 856.4625, 857.4625 and 858.4625 as permanently allocated data
channels. If they are actually a part of one of he above I have no way ot
telling which..

859.4875 seems to be consistently used as a phone patch. Again, don't know
which system it is a part of.

866.4875 doesn't seem to belong to any of those three control channels
though I've heard voice traffic on it. Sounded like some EMS dispatch but I
don't know where.

I've not yet heard anything on 856.7125, 857.4875, 857.7125, or 858.7125.
I'm still trying to track those down. I've heard voice traffic but not yet
isolated 859.2125, 859.4875 and 860.4625.

I still don't know what this all means. It seems odd that Harris County
would operate three separate systems. John's comment about the system being
a type IIi system may be accurate but it sure feels like three separate
systems.

If I come up with anything else, I'll let you know...

-Linda

Linda.Thomas@dialaccess.com,

Good question. With your Uniden came a booklet of trunking systems.
Surprisingly, that booklet is more accurate for Harris County than Police Call.

Saturday May 23 1998 13:04, Linda.Thomas@dialaccess.com wrote to All:

LT> From: "Linda Thomas" <Linda.Thomas@dialaccess.com>
LT> Subject: Harris County, TX trunk system has me baffled

LT> I'm hoping that someone can help me out here. Please reply directly as I
LT> don't always get to read this group in a timely manner.

LT> I just got a new BC895XLT trunk tracker and I promptly went to enter the
LT> trunk frequencies. Here's where the first problem begins...

LT> From the 1998 Police Call, I get a set of 25 frequencies 856-860 at .2125,
LT> .2375, .4625, .4875 and .7125. These are all registered as WNBZ674.

LT> There are another set of 26 frequencies between 866 and 868 registered to
LT> WPKL474.

LT> So I'm thinking, "ok, there are two distinct systems" and I go on to look
LT> at the first one. Here it gets stranger...

LT> There are two control frequencies in the first set. Depending on which I
LT> program in, I get different traffic. Is it possible that the first set of
LT> frequencies itself encompasses two systems? If so, how can I tell which
LT> go with which control? Or am I missing something else and just confused?

LT> The second set of 26 frequencies is much less active overall but it also
LT> has a control channel.

LT> I know (or at least think) that a trunked system can't have more than 30
LT> frequencies so I don't think the two sets of frequencies could be combined
LT> into a 51 frequency system.

LT> Does anyone know how I can figure this out? In the first set of 25, can
LT> two distinct control channels share the same set of frequencies? If this
LT> is the case then I can only trunktrack one at a time.

LT> Any insights would be greatly appreciated!

LT> -Linda

Maybe you don't understand that little squiggle thing you put at the end
of "Now how could I guess that" makes the sentence into a question, ask
your English teacher to explain it to you.

The question was preceded by a vague supposition, a common ploy of the
ignorant, ask you tutor to explain it to you.

>In any event, you act like an OS/2 type.

Whilst we have supplied OS/2 systems to clients I have never used it and
have not noticed anything untoward about these clients. I much prefer
Solaris.

> And I'm
>not so sure my guess is all that wrong. Maybe.
>But you'd not confess if I were right.......

The 'what ever you say you are guilty' is a common ploy of the paranoid,
you should ask your therapist to concentrate on this unendearing trait.

Try it on the 16 pin IC MC 3373 (don't know for sure if this is the rigt number but open the AR1500 find a 16 pin SMD IC on the middle or third layer search the internet for the number on that IC and it will tell you if you've got the right one !)The baseband audio can be found on pin 9 of this IC.

Sorry for this incomplete message but i build in the modification on a 1500 from a friend of mine about 1,5 year ago and cant remember everything exactly for that long !!

please mail me for further questions !

The following is a comprehensive listing of Conrial frequencies along with a meager listing of Amtrack freqs. With the recent CSXT/NS acquisistion of Conrail some frequencies my be changing, but I haven't noticed anything yet. Feel free to give input on the questionable freqs, the ones with (Mobiles?) are freqs that I couldn't find channel designations for yet had hundreds or thousands of mobiles liscenced to that freq with little or no base stations. If you're looking for freqs, the ones with assigned channels are good ones to start, then do more reseach on other ones for your area. Thanks again for any input you can give . . . .

Well you have three choices here, you can either replace the cpu
yourself, or if you don't feel you can do it have some one more
qualified to do it, or just replace the whole logic board with the
new cpu already installed. I do think some where in the very resent
past you may have refered to the fact that things can be done in the
way of mods if some one is willing to pay for it.

Is there a way on this scanner to make the steps
5kc in the 220 mhz ham band? I got this radio
cheap < $70 > and was just wondering if the steps
could be changed. The current step is 12.5kc and
that is useless on 220.
thanks in advance
kd5amz
kevin

5524. f.s. car alarm - wireless pager type

Newsgroup: rec.radio.scanner
Date: 1998-05-25 00:00:00 UTC
From: "J.P." <ishyguy@idirect.com>

Source record: 159635

--
ishyguy@idirect.com

for sale: a car alarm that sends a signal to the pager for up to 1/2 mile.
this is non-audible, but can be hooked to an existing alarm system that is.

there are trigger in/output jacks. external antenna (uhf-input) can hook up
to
a cb antenna for greater distance. comes with 2 sensors, antenna, pager,
and mounting bracket. can also be looped throught existing car antenna -
with
a basic motorola male to male cord.

45.00 US includes shipping

thanks for your considerations

> If not then you can not know what was there.

No, I wasn't there. And you're right, I can't know
what WAS there. But I can (and did) tell you what
WASN'T there. That was easy, too.

> >I don't know what you saw, but you did not
> >see a WiNRADiO in any semblance of a market product.
>
> Agreed that a lack of screening and filtering would make it unfit to be
> marketed, but it would not prevent it being marketed.

With the WiNRADiO company, it would have. Maybe
not with other companies.....which is why I think
you saw something else, or....can't remember what
you saw....or aren't telling the truth about what
you saw or thought you saw.

> >Or if you did, (unlikely), it was not a product that
> >ever hit the USA market.
>
> When did it hit the USA market? It was in the UK in May 96.

I don't know right off, though I can find out
if it's important. However, I began journalistic
coverage of WiNRADiO in July, 1986. And got a
unit in that same time period.....and what's more,
it was manufactured quite a few months previous,
like in early 1996...the date of which is obscured
by other cards in the PC right now....but you get
the idea.....

> >You did attempt to spew inaccurate and untruthful
> >characteristics of the current WiNRADiO.

> Ah, "current". I have accepted that what I described is not the current
> WR-1000i.

Now accept that whatever you saw was never "current".
It wasn't a market WiNRADiO. You simply are mistaken
in your recollections. The fact is that the current
configuration of WiNRADiO has been shipped to the USA
ever since mid-1996...and you can see a picture of it
on their Web site.

So it makes no sense that you saw what you claim in
May, 1996. The current version was already in
production and distribution on that date.

Every once and a while my scanner slows it's search and scan speeds. I assumed it was the batteries, but when I plug it in the scan rate doesn't pick up (at least not immediately). I haven't tried plugging it into the power jack to see it that works only the charge jack, but it seems to me that that shouldn't matter because it's getting full juice. Or, is this a sign my nicads are going-they are quite old. Also, if it's not the batteries, what could be the cause. Mine is a full coverage scanner, and I wouldn't know where to get it fixed.

I've only been soldering for 35+ years and have
done many an SMT CPU. And I would call it anything
but a piece of cake. Doable, sure. Any semi-pro
worth his salt can do it. The vast majority of
scannists can't....and even if they paid to have
it done, the result isn't all that exciting.

> By the way, the part of the radio that RS covered with epoxy was

Hi, I live in Gadsden, AL and we have an 800 Mhz EDACS system. It's freqs that are listed on the FCC site are all available on new scanners. I had a guy tell me that they also used 878.187x and 879.187x. Anyway, those are part of the spread deleted from new scanners and I was thinking those bands were only common carrier cell phones. Does anyone know anything about numbers such as these being used exclusively for law enforcement? Many thanks in advance....Bill

All ri--ght! You betcha, and tell the good folks
how much THAT animal costs, and tell 'em about the
EXACT results when it's all said and done.

> I do think some where in the very resent
> past you may have refered to the fact that things can be done in the
> way of mods if some one is willing to pay for it.

Sure. But you can't get blood out of a turnip.
And you ain't gonna get the US cellular bands
with 30 kHz steps, come hell or high water.

Take that to the bank.

:-)

There are! Voice band filters betwixt the volume
control and the power amplifier.

> What is this discriminator tap and do I have one?

The PRO-64 has a Discriminator but you have to
"tap" it.

> If not, can I make one or buy one?

I suppose you could hire someone to do the work.
For the tap, you need only a capacitor and a
jack of some sort.

> How would it hook up to my scanner?

See my recent post on this newsgroup under the
subject: SCANNER DISCRIMINATOR DATA

That article will fix you right up.

Pipe digital data signals out of it to an external
interface and use software to decode that data and
display it on your screen or store it in a file.

And have some fun. Decoding data signals is
the "in" thing that's going on these days.

Haven't you followed the thread? Yupiteru
radios are illegal to import into the USA.
Money spent on them lines some fat cat's
bank account overseas, the benefits of which
don't come back here.

And if that ain't enough, Yupiteru doesn't
care enough to certify its products for sale
in the USA, so why should we be interested in
it? And even if we were, there is no service
or support for it in the USA. No service manuals
either.

It's got stink all over it. That's why I replied
to the question, which you'd have seen, had you
read the thread.

Eh?

>TheLibNet Spew, Drew? I wonder?

I noticed you conveniently ignored the rest of my question. Once more: why do you persist in following me around this newsgroup? Why do you feel it necessary to answer EVERY one of my posts, whether they involve you or not? Why do you feel it necessary to post articles like "Where did Spew go?" and "Come back Spew, I'm not through with you yet!" when I disappear from this newsgroup for a few days? Why are you SO obsessed with me that you, by your own admission, spend many hours' worth of time searching DejaNews for old posts that have been written by me or by others whom you believe to be me? This is not exactly normal behavior. Just what exactly is your interest in all of this? Please share with the class.

(snip)

I am relatively new to the scanning hobby (started a few years ago), and I rarely look at newsgroups, but I came to this site to pick up a few tips for a possible scanner upgrade. I believe I purchased a helpful book by Mr. Cheek when I was first starting out. But the bitter adolescent flaming that he engages in here not only makes it a little more difficult to glean useful info from the group, but also makes me regret having purchased his book. Mr. Cheek, you really do yourself a disservice by lowering yourself to such a level. Negative word-of-mouth can wreck a career, and with this posting you scream to a whole internet audience of newbies and potential book-buyers, "I am a bitter asshole, don't buy my books."

Now I suspect Mr. Cheek will reinforce my perception by turning his guns on me...

BTW....you needn't ever wonder why I have no concern about my "reputation" with you. Hell, dude, you can't even read, or understand what the hell you do read. Why should I be worried about my "reputation" with you?

(snip)

I have a suggestion... everyone who is reading this thread and finding Mr. Cheek's abusive posts to be offensive might like to do the following. (1) Print two or three of Cheek's most bitter flames (2) make photocopies (3) highlight the "from" line so readers can quickly identify Mr. Cheek as the person who posted the hateful material (4) go to your nearest radio shop or spy-supply shop that sells Mr. Cheek's literature, find copies of his books if possible, fold the photocopy in half and slip it into the book somewhere around the intro or first chapter, for a newbie reader to find while browsing the book.(5) Watch Mr. Cheek's posts here get more and more angry as the chip on his shoulder slowly erodes his base of support! "You may say I'm a dreamer, but I'm not the only one.."

Yeah! I've got him talking about snot! I have inspired scanner expert Mr. Bill Cheek to talk goo-goo baby insult talk about snot! Can we talk about "doo-doo" next, Bill?I'll even say it first. Doo doo! Doo doo on you and your doo-doo mama! Goo!

> Yessiree there, Slick, you just heist your monstrous
> patooty up on that stump and beat your chest and
> drum up the legions.

Oh, I will.. but you see I've already succeeded in drumming up the legions... the legions of demons crawling around in that hateful mind of yours! Say, Bill, let's see whose demons will win, cause obviously I've got 'em too. We are both angry losers, we have been hurt by life and we want to hurt everyone right back.. so let's give everyone on this newgroup the chance to watch our virtual battle in text. Let's just go back and forth like this for the rest of the week. I'll take a little time off just for you. No, scratch that, I have no life and no job and nothing, absolutely nothing to lose. That's who you are dealing with. Feel the hate, Bill. Taste it. Taste the bile, you decaying sack of shit. Let it inspire you to insult, to slash and burn with every strike of your fingers on the keys. Let it eat at your bowels and ring in your ears like a whole mighty chorus of unclean spirits from the sulphurous depths. I've helped push you a little closer to your own personal edge, your inevitable but untimely slow suicide in the form of ulcers or liver cancer or whatever form of decay your bad chemicals and fermenting hatred may precipitate. Hooray, Bill, I have made you just a little angrier, I am a jerk and an asshole too, so spend the rest of the night hating me and insulting me in the loneliness of that room.Hail Satan! Threaten me, Bill! Please threaten me and attack me! Strike the first blow, end my miserable existence! I want nothing more!

Hallelujah,

Mel

Attention Fellow Computer Enthusiast:

***** C O M P U T E R S O F T W A R E F R A U D A L E R T *****

%%%%%%%%%% C O R E L S O F T W A R E E X P O S E D %%%%%%%%%%

HERE'S A TIP TO HELP YOU AVOID SOME FUTURE GRIEF (AND SAVE SOME OF YOUR HARD EARNED MONEY)

PC World Magazine, in their February issue made reference to a particular software title as

'THE SOFTWARE FROM HELL'.

I've never used the product they were referring to, so I can't comment about it.

Nevertheless, if PC World had been talking about software from

COREL CORPORATION (Word Perfect, etc), it would have been MOST APPROPRIATE.

COREL SOFTWARE PRODUCTS, IN ALL THEIR FORMS, TRULY DESERVE THE TITLE

****** S O F T W A R E F R O M H E L L ******

because they are buggy (and dysfunctional) beyond belief. Corel products make Microsoft look like the knight in shinning armor, even including Windoze 95.

YOU CAN'T READ INFO LIKE THIS IN THE COMPUTER MAGAZINES BECAUSE COREL SPENDS FAR TOO MUCH MONEY VIA ADVERTISING REVENUE WITH ALL THE COMPUTER PUBLICATIONS, AND THEY DON'T DARE EXPOSE ONE OF THEIR BIGGEST ADVERTISERS, FOR REASONS WHICH SHOULD BE OBVIOUS. THEREFORE, WE CAN ONLY HOPE TO PASS THE WORD VIA NEWS GROUPS AND SIMILAR OUTLETS.

Corel Corporation, a Canadian firm, based in Ottawa, Ontario, has zero regard and zero respect for their customers, and is probably the best example of why Ziff Davis (publishers of dozens of computer magazines, both on the PC and Mac platforms), are now calling for a mandatory (and legally binding) 30, 60 or 90 day software money back guarantee.

Using data from Corel's own website, the following is more than sufficient proof to demonstrate the dysfunctional character of Corel's Word Perfect product:

THE FOLLOWING BUG LIST IS TAKEN FROM COREL'S WORLD WIDE WEBSITE:
==========

ftp://ftp.corel.com/pub/WordPerfect/wpmac/-WPMac ftp Index.html

(scroll way down, almost to the bottom)

What follows is the list of bug fixes initiated by Corel in an attempt to repair their cockroach infested product known as Word Perfect, version 3.5, which can easily be construed as a clear admission of bugs which existed with version 3.5 as shipped to customers on CD ROM. What makes this issue all the more criminal is the fact that Corel refused to inform customers who sent in their warranty registration cards that bug fixes had been released for this product. Corel Corporation refused to send warranty/registered customers the patches on floppy disk, and if this was too expensive, Corel Corporation even refused to send registered customers a postcard informing their customers where they could find the patches on the Internet. Customers were simply left to struggle with a totally dysfunctional product. And customers like myself who finally figured out Corel Word Perfect could NOT be made to function properly, and who first requested assistance, were ignored, and who later requested a refund, were also ignored.

TO THIS DAY, 17 MONTHS AFTER THE PURCHASE OF THE DYSFUNCTION AND COCKROACH INFESTED COREL WORD PERFECT PROGRAM, THIS COMPANY CONTINUES TO IGNORE ALL INTERNET E-MAIL MESSGES AND ALL UNITED STATES AND CANADIAN POSTAL SERVICES LETTERS.

==========

Corel Document ID: 10339

The information in this document applies to:
WordPerfect 3.5 for Macintosh

This Updater works with all versions of Corel WordPerfect 3.5. Including: Novell WordPerfect 3.5, Corel WordPerfect 3.5.1, Corel WordPerfect 3.5.2 and Corel WordPerfect in the CorelDraw Suite.

The Corel WordPerfect 3.5.3 patch replaces all previous patches for WordPerfect 3.5, including the Corel WordPerfect 3.5.2 patch shipped in October of 1996.

Fixes in 3.5.3 patch
==========

- Conversions should now function normally under System 7.6.
- A bug was fixed that repairs some display problems.
- Sporadic warnings that the common library could not be found will no longer occur.

Fixes in 3.5.2 patch
==========

- Text Selection now works properly.

- The Print Envelope feature will print addresses in the correct position on the LaserWriter 8.4 printer driver.

- Deleting to the right at the beginning of a line will no longer cause the cursor to reposition incorrectly in the text above.

- Deleting just before a Style no longer causes the cursor to reposition incorrectly and delete text within the Style.

- Editing a document in ?Show Codes? no longer causes the cursor to reposition incorrectly.

- Headers/Footers with text attributes (bold, underline...) are no longer affected by text attributes that cross a page break.

- Deleting addresses in the Print Envelope delivery or return address window now functions properly.

- The German Dictionary no longer stops and marks incorrect every word that contains a ? (esset).

- The French Dictionary on a Power Macintosh no longer stops and marks incorrect words that contain a ? (acute).

- Delivery Point of a bar code is no longer automatically calculated.

- Import of tables from various document types has been improved.

- The title of the ?WP6.x Export? now reads ?WP6.x,7.x Export? in both the patched and resale CD product from Corel.

- HTML export now saves Corel WordPerfect graphics or .wpg formatted images as JPEG?s.

Fixes in 3.5.1 patch
====================

- Editing some long blocks of Japanese characters will not crash the computer.

- Screen display is faster after scrolling through large documents or tables, or making editing changes.

- Captions can now be positioned above a graphic or text box.

- Return and delivery addresses in Print Envelope will now allow 255 characters (including line breaks).

- Dictionaries are now listed under the Dictionary menu instead of the Check menu.

- Ruler Bar display problems with PCI Power Macintosh computers have been fixed.

- WP 6.x and WP 7.x conversions can now be canceled.

- While working in subdocuments?such as headers or footnotes on black and white screens, Corel WordPerfect does not quit unexpectedly when clicking in the ruler area of the subdocument.

- Zip codes beginning with zero which did not have extended zip code digits now function properly in the Print Envelope feature.

- Font menus in Preferences and Print Envelopes now work properly on small monitors.

- Cleared tabs will no longer unexpectedly reappear on the ruler.

- Hyperlink copy and paste are now working.

- Cell Protection now disables the deletion of the contents of a cell.

- The bottom border of a table which crosses a page break is now visible.

- Patterns in a cell will no longer disappear when performing a Split or Join.

- Joining with the first cell of a table now functions properly.

- Row selection of tables in a text box is now available.

- Scroll bar does not stick when scrolling.

- Corel WordPerfect will use the Language Resource file designed for your system if present, or default to English (USA).

- Page Setup is now enabled in the Print Envelope feature (this allows the selection of paper sizes and envelope trays).

- Changing QuickCorrect preferences with no documents open will no longer crash the computer.

- Tables and Page Borders now work together.

- The PowerTalk Mailer can exceed 4096 characters.

- In the new Corel WordPerfect 3.5 CD-ROM, Norton Utilities will no longer report an error in the WordPerfect Installer Read Me. This fix is not available in the patch, but if you use Norton Utilities, we suggest you delete the WordPerfect Installer Read Me since it is not required for proper operation of the software.

- Corel WordPerfect Dictionaries and QuickCorrect word lists will no longer be replaced during installation.

==========

Postscript:

The above represents the bug list for Word Perfect 3.5, as I purchased this product, these revelations coming directly from Corel's website. Considering all these problems, it is little wonder that Ziff Davis Publishers are now suggesting we have a SOFTWARE LEMON LAW to protect computer consumers from future issues of this sort of software larceny.

If the reader will examine the websites of PC Week, PC World, and a few other leading PC-platform computer magazines, he will discover that Corel's Word Perfect, Suite 8 (the latest offering from Corel) is likewise

full of bugs. Don't take my word for it--- check it out for yourself.

MORAL OF STORY::::

SAVE YOUR MONEY--- DO NOT BUY ANYTHING WITH ���COREL��� ON THE LABEL, WHETHER IT BE FOR IBM COMPATIBLES OR THE MACINTOSH !!!

From: jocatch@ibm.net
Message-ID: <356ac00a.3541203@9.66.15.32>
Source record: 159430

Bill, I have owned an 2042 for about a year and I am not real happy
with it. I bought it new. Some of the "problems" I have with it are:

1. Delay function doesn't work all the time: some times the DELAY
function works, other times it doesn't.
2. Cuts off before end of conversation: sometimes it resumes scanning
while the people are still talking.
3. Seems to "miss" active frequencies when scanning.

I never brought it back to RS because I was never sure that perhaps it
was my reception area or the control settings. I have the squelch
turned just a little past where it cuts out the hiss. I have also had
many other scanners so I don't think its me.

Do you know of any mods that would fix these problems or do you think
the unit is defective?

Joe C.

>HEREï¿½S A TIP TO HELP YOU AVOID SOME FUTURE GRIEF (AND SAVE SOME OF YOUR
>HARD EARNED MONEY)

This is about the biggest bunch of drivel I have ever read.

Everyone does NOT have the massive resources of Microsoft and Microsoft simply doesn't admit to having any errors (even to the United States Congress under oath).

I would much prefer a list of errors... and fixes... that can be downloaded from a web site (no matter how difficult it might be for me) than denial that there even is a problem. The only people that have ever sent ME notification of bugs in their software is Intuit... and they have a financial interest in not making errors in the tax returns they generate.

I have never heard from Microsoft or even IBM... but I check both sites.

If you want to see a list of errors, check out IBM's for OS/2 Warp 4 (for instance). It makes this sniveling list of 41? fixes look like the program maintenance guys aren't even working at Corel.

By the way "J." which gave you the biggest problem in the list of errors, the German "esset" or the French "acute" accent? Did the title change in 3.5.2 really improve your productivity (or at least get you out of a work stoppage). Which tables that you couldn't import before did they add with their enhancement (not fix) that really got you out of a hole. Of course, if you are editing long blocks of Japanese characters, those constant crashes must be annoying (I personally never encountered that problem with MS Word, but I don't think it handles Japanese... I know I don't).

You can save yourself a LOT of money, by waiting until perfect, thoroughly debugged software is available... you'll never need a computer.

On the other hand, if you want to lease code at multi $1000s a month, I KNOW IBM gives you far more personalized and direct support.

In the meantime, beware Microsoft, they may not even tell you of a known bug.

Ron

Source record: 159436

I have just bought a Pro2045 on a closeout from Radio Shack. After it is on for about 5 minutes, parked on an FM freq, like the 162.55 weather freq, the audio will gradually grow fainter and fainter. Also, if searching from 30-1000 MHz, as it passes through the AM bands, like 225-400, the audio comes back. But when the search enters an FM portion of the spectrum, the audio fades again.

I can exchange this Pro2045 for another one at Radio Shack, but I am wondering if this has been a chronic problem. I am also wondering what could be wrong with the unit. Does any one know?

>worth this amount. I had one years ago and would like to have it for a
>desktop unit to go along with my AOR8K.

I would pay between $150 and maybe $225. Used 2006's go for about $250 to $300. Oddly, I haven't seen too may 2005's. $175 for a 2004 in good condition is a good deal. The electroluminescent display may be out or it may be dying, but you can still see the display in daylight, but that backlight will die sooner or later. Radio Shack is sold out of replacement panels.

Gosh, sounds to me like there is a defect somewhere!
I had a PRO-2035 (same radio in hardware) and there
were no issues like that. Check with other 2042
owners, but those issues you mentioned are new to me.
I'd see if the warranty is still good and get it fixed
if I were you.

It sounds reasonable....if the unit works
and is in clean, relatively unmodified
condition....or, if extensively modified,
then are the mods professionally done, or
perhaps by a rank amateur?

The price is a little steep, but for one of
the best radios ever, I guess it's in the
ballpark. Just that spare parts aren't
available anymore....and repairs could be
costly.

Hi ya Al!

There probably is no sense in wrestling with
that unit and its problems. Take it back for
a replacement.

But if you must....get a can of "circuit chiller"
and spray selected small areas around the audio
section, especially in the areas of the audio
preamplifier and power amplifier.

Sounds like a heat-related issue and a bad contact
somewhere...maybe a defective solder joint or
a heat-senstitive component. The "circuit chiller"
should help in locating the problem.

Yes, yes - the law and general ban on cellular capable scanners in 94.
But I was talking about the specific "ban" on the AOR8000 which until
sometime in 97, I believe, was still being sold legally.

> Perhaps. But those scanners were still illegal.
> The interpretation of software locks might not
> have been clarified until 1997....I don't know

Perhaps the AOR 8000 was determinined not to be in compliance
with the rules (and perhaps never was) in 97, but as long as the
scanner was sold (with FCC certification) and the radio was not
unblocked by software, it's fair, for all practical purposes, to
consider the scanner as "legal", since the layman could nothing but
believe a scanner which was freely sold (and FCC certified)would be legal.

But you are quite right that this is certainly a exception to the rule ...
In general, scanners since 94 were not readily capable of cell restoration.

I have a Icom R7000 RX. Is there a mod that will enable coverage below 25mhz?
I have been told there is but can not find any info for it. Thanks in advance, Mike K4VJ

5599. Pro-74 vs. Pro-90

Newsgroup: rec.radio.scanner
Date: 1998-05-26 00:00:00 UTC

Hi folks,
I am new to scanning and I purchased my first scanner this weekend.
The sales lady told me that the race scanner was pretty much the same thing
as the "trunk" scanner, but cheaper. Is "trunk" that much better?
I don't think I'll ever go to a race...should I take my pro-74 back
and get the pro-90? Any info greatly appreciated. Thank you!!
Danielle

Modify it to do what? It gets images on the high side of certain popular
frequencies right out of the box & that's probably as close as you'll come with
any new Uniden design.... Takes an outdoor antenna in some spots to do it.
Imports with no blocks start around $300-400. Comparable used pre-94
units that can accept an 800MHZ mod are selling for 1.5 -2 times the current
price of the 2045 and lack many nice features. If all you want is unblocked
cellular, take the 2045 back & take your chances on a used Bearcat 855 or other
old cheapy 16 -50 channel 800MHZ scanner from 1994 or earlier. My local
pawnshops want $100 or so, untested. Your mileage could vary, lucky breaks
happen all the time. These may be bought around $130-$150 in the used markets
on the web.
For others in the market, I've spent many many hours looking on the web
and elsewhere & there are no easy, straighforward cell mods that your average
hobbyist can do on current US production scanners. If you feel good changing a
100 lead CPU, and can find a source for the right one, go for it. Maybe I've
missed the "magic" website that "tells all", but I doubt it. I was sure "there
ought to be a way" too, but I've learned differently. Good luck.
BTW- The FIRST mod I'd do to a 2045 is an external speaker jack. The
headphone jack up front obviously has a big dropping resistor in line!
```

Look at the ISOTRON by Bilal Co. (1-719-687-0650) Ask for there catalogue.

They make a good antenna for a low price. I use them, they work great. A 20 Meter Antenna is only 21" long X 8" wide X 4" tall,,,,,,,,,,, there 40 Meter is 15" deep X 16" wide X 22" high. Try to beat this for size.

To everyone reading this newsgroup,

My name is Russell Jackson, this internet account belongs to my wife Melba and I.
I would like to sincerely apologize to all of you for postings made late last night by someone calling himself "Mel." This is my wife's nephew David, who is a very intelligent boy and gifted student but very deeply disturbed emotionally. We were shocked and saddened to see what he had written, and worse yet we have discovered that he is involved in a Satanic cult.

I can assure everyone here that he is now getting the help he desperately needs, and this terrible sort of thing will not happen again. After meeting with the boy's psychiatrist and attorney I am afraid that's about the best I can do right now.

BTW I am a Christian minister and I respectfully ask all of you who are believers to join us in praying for David. Pray that he will be delivered by the power of Jesus Christ.
I know this is a very strange situation and an off-topic posting, but we are just beginning to try to undo the damage he has done. We are doing the best we can.

God bless you all, and again, you have my sincerest apologies.

Rev. Russell Jackson

You do you have a data slicer between the radio and the sound card?
Make sure it's not plugged into the microphone jack form experience this
doesn't work.
If you do have a data slicer on the radio you may want to put a alignment
trim pot between the slicer and the radio.

[Image]

By adjusting the trim pot you can have a heavy effect on the output of
the data slicer.

This is about what I use. After you get it in a useable range about
mid position on the bar graph record a sample of it on your sound card
and use a simple audio recording utility that has a wave form view and
look close up at the digital signal. The corners of the wave form should
be as straight as possible.

When I use this program I get between a 95% and a 100% average.

>Danielle

The trunk scanner is a completely different scanner from the pro-74.
Trunking is a relatively new way by which several groups of radio users
(such as the police, fire, and ems personnel) communicate while sharing
fewer frequencies. The radios essentially switch frequencies in unison
(much like how cell phones switch frequencies but stay in touch).
Conventional scanners like the pro-74 can not read and interpret the control
signals to
follow the frequency switching, but the pro-90 does it and also works as a
conventional scanner. Since you are not into racing, even if you do not use
the trunking feature, in my opinion, the pro-90 is the better unit. (I
bought one and returned it. I subsequently got an AR8000. Still, I am going
to wait a while and either buy back a trunker or see if someone comes up
with an acceptable portable trunking device which works with the AR8000).
The better buy is determined by factoring features
and prices.

It seems as if the sales person is either ignorant of the products or she
has reason to push the pro-74.

Richard

It is a adapter box that adds 400mhz to any scanner frequency. There is a 9v battery inside to operate turn switch on for example program scanner to 488mhz turn switch on search up and down.

> I am new to scanning and I purchased my first scanner this weekend.
> The sales lady told me that the race scanner was pretty much the same
> thing as the "trunk" scanner, but cheaper.

I think you either ran across another uneducated salesperson or she
confused the new PRO-74 with the new PRO-91. The PRO-91 is the
PRO-90's baby brother/sister...it only has half the channels/banks
of the PRO-90. They are both TrunkTrackers made for Radio Shack
by Uniden.

> Is "trunk" that much better?

Nothing to do with "better". It's a feature. It refers to
being able to follow a trunked radio system. Don't know
what that is? See here :

http://www.qsl.net/n2mca/NEW_USER.HTM

and then find out if you have any systems in your area
that you can use this feature on. If not, then you might
be wasting your money on a feature you'll not use often,
if ever.

> I don't think I'll ever go to a race...should I take my pro-74 back
> and get the pro-90?

If money is not the object, then the PRO-90 will perform better
than the PRO-74 as well as providing more features. But do you
understand what the PRO-90 is and what it will do for you?

> tell me about these radios?

You really shouldn't be considering the R1 as it only has 100 memories
and you wanted "tons o'memories" and it isn't computer controllable.
Perhaps you are confusing it with the newer IC-R10?

With all you've said, it does seem as though the AR8000 and R10 are
your only choices. I wouldn't recommend the DJ-X10 either since
it's performance on HF is very sub-par and that seems of importance
to you.

As for HF being "not a joke", you might not be happy with any
handheld model as they are all inferior to a "real" HF radio.
Some do quite well but their forte is VHF/UHF monitoring.

If you want to read more, I have reviews of the AR800 and R10 at
my site listed below. Go to my home page and follow the radio
monitoring link. Page down and you'll find a button for my
Radio Review page. You should be able to take it from there.

Best of luck with your decision!

I have delt with Jerry (the owner) at G&G several times to have radio's
and pagers repaired. Even though they are a bit slow due to being
back-logged, I have found that the service is worth waiting for.
Reasonable prices, and good quality work.

If you have a trunktracker scanner, then consult your owner's manual about how to program fleetmaps for Type 1 and Type 2 hybrid systems. Near the end of my manual there are several fleetmaps listed that are "preprogrammed" into the scanner. I assume that they are preprogrammed because they are the most common fleetmaps. A custom fleetmap can also be programmed into the radio. Since I have not been able to confirm that the Harris County system matches any of the preprogrammed listing, then I believe a custom fleetmap is needed. So how do "we" figure out a fleetmap. Trial and error perhaps. Program different size codes into different blocks until one works correctly. Or maybe somebody knows someone that is more knowledgable about the technical aspects of the system. If I figure it out I will post it at http://members.aol.com/jdhtex/houstonscan/ .

Leo.Waltz@prodigy.net,

Here's what I've found out. Yes, there are four separate systems, each tends to favor an area. These systems also work together in a Smartzone arrangement. If you do not program 860.2125, the scanner functions correctly on the main system in Houston. This is where SO runs. The little systems are more for the outlying agencies. For example, my VFD switched to Clodine because their HTs had trouble reaching into Houston.

Do you have any idea what you're asking for? This list would make a small book.

Why don't you go to the Saint Johns Industrial airport (or any airport) and buy or ask to see the SAC for those areas? (SAC is Sectional Aeronautical Chart, commonly refered to as just "sectional")

Ask for the
LA sectional, (it also contains San Diego)
LV sectional
Phoenix sectional
Albuquerque sectional.

A SAC is an areonautical map covering a very large area and it will have all the freqs for the specific airport you listed plus ALL the airports that lay within the coverage of that SAC.

Have fun,
PJ

There is a difference between the LCD display and
the electroluminescent back light. As far as I know,
the LCD display is not subject to degradation or
"wearing out", so long as it is operated between
the environmental temperature limits.

The back light is another story. It wears out.
Even when it is completely out, the LCD display
should still be readable so long as there is
any front light at all.

>it correct the problem?

the speed of scanning slows down (?) with many scanners if you
program different freqs (seperated by a lot of freq) in consecutive
channels.

ie.

CH FREQ

1) 146.520
2) 1999.000
3) 52.520
4) 902.000
5) 146.460

You can correct this by programming:

1) 52.520
2) 146.460
3) 146.520

Hi. I am from Montreal too.

you may want to ask this question in DX listeners net at Sunday 8:15~
on 146.910 MHz. (they have a scanner portion of the net at the very
end)

They sometimes give you good stuffs (freq for public service etc.).

Please understand that my "reputation" with you is
not subject to barter or negotiation or sale. If
you wish to tarnish it, then do it. If you don't,
then don't. Either way, it is your decision and I
shall not participate in it or enter into any
negotiations with you about it.

Comprende voux? Savvy? Understand?

Now that we have settled that score, would YOU be
so kind as to tell me how my following quoted post
is about ANYTHING other than "scanner related matters"?

BC> Good or not, they're illegal to import into
BC> the USA. And there is no service and support
BC> for them. Just TRY to get a service manual,
BC> ferinstance.
BC>
BC> Worth a thought before sending out that hard
BC> cold cash to Europe.....notably to a manufacturer
BC> that doesn't care enough to get its products
BC> certified for sale in the USA.

How the hell can you interpret the foregoing to be
about anything else? What did you think it was about?

BTW....you needn't ever wonder why I have no concern about
my "reputation" with you. Hell, dude, you can't even read,
or understand what the hell you do read. Why should I be
worried about my "reputation" with you?

Do tell......PLEASE.

The "ban" was in 1994. The action was the infamous
Telephone Dispute and Disclosure Act of 1994.

> the AOR 8000s which were legally sold in the US,
> could have cellular range restored via software alone ....
> All you had to do was run a program that altered the

Perhaps. But those scanners were still illegal.
The interpretation of software locks might not
have been clarified until 1997....I don't know
about that. But I can submit that it is the
exception to the rule.

>7100), Will an outdoor antenna always have benefits only, or can it
>"overpower" the reciever? I'm thinking for now any of the Radio Shack
>antennas like the discone or the smaller ones.

I use a PRO-2003, a PRO-2004 and two PRO-2006 scanners. I get adequate results when I use the telescoping whips, but I've found that ANY antenna is better than those! The 2006's each have a set of $19 K Mart rabbit ears. I've heard 30 MHz skip on both of them as well as 2x 15 MHz shortwave images. The PRO-2004 uses a Radio Shack all-band mobile whip, the one with the two loading coils. The PRO-2003 has one of those funky RCA jacks in the back, and it uses a broken down mobile whip. At times it seems somewhat more sensitive than the 2006, which sits on top. The 2004 and other 2006 are at a different location.

For mobile use, I have a PRO-51 handheld. Attaching any external antenna other than the rubber ducky sometimes causes overload if I'm in the city. Using the Radio Shack mobile from above, I was able to hear the local dog catcher on 158 MHz at a distance of about 65 miles. The local police on a 453 MHz repeater system were heard out to about 50 miles or so.

If you've got the room, by all means, put up an external antenna. I have sometimes used a magnetic mount mobile antenna hung upside down with the base clamped to the top metal frame of the window.

>that comes close to the 200mA needed.

The current drawn by a load is not dependent on the current
rating of the source, but by the effective resistance of the load.
Ohm's Law and all that...

>According to the R1 manual, the internal NiCd is rated
>at 300mAh. So I'll have to assume there is some sort of
>current limiting inside since the charging time is spec'd
>at 15 hours!

200 mA would be excessive even for standard AA Ni-Cads
(500 to 1000 mAH types), so there is obviously control/limiting
circuitry somewhere. I doubt that it is in the stock AC adapter.

The best way to proceed is to purchase the multi-voltage
adapter, select the correct tip and polarity, then use the
lowest voltage setting that provides sufficient charging current.

One of the settings between 6 and 12 volts will be the appropriate
choice; Just use the one that produces a full charge and doesn't cook
the cells. This advice applies to just about every scanner in
existence.

>Looking at the latest AES catalog, I don't see a listing
>for the BC-74A but most of the AC adapters for the iCOM
>products run $30. The Radio Shack price on the above
>adapter runs $13.

BTW, these adapters are available from other sources for
as low as CDN$5 (around here, anyway!)

BTW/2, checked out a bit of your site; have a couple of comments:

>Frequency counter
> Device used to sweep a very wide range of frequencies(1 to
> 2GHz) in a very short period of time(1 second) and display the
> strongest signal detected.

This certainly isn't how a run of the mill counter operates.
(Most don't start at 1 GHz either) :)

They don't "sweep" the spectrum, and the frequency coverage
varies from one model to the next. There are counters that
are designed for use below 50 MHz only, and are used by CBers
(for example) to tune their rigs. Also, the gate times vary
considerably, and many models offer several gate times, ranging
from about one-tenth of a second to ten seconds.

Also, just to pick a nit, why not write the following sort of thing...

> Usually used to detect an unknown operating frequency. The
> counter is triggered at very close range to the transmitter at the
> moment it is activated thereby revealing the frequency being used.
>
> See FREQUENCY

...as...

Usually used to detect an unknown operating frequency. The
counter is triggered at very close range to the transmitter at the
moment it is activated thereby revealing the
<A HREF="glossary.htm#frequency">frequency</A> being used.

After all, it _is_ an HTML document!

BTW/3, your Cadex Electronics Inc. link needs updating.
(Should be www.cadex.com)

BTW/4, nice site, keep up the good work.

...Andy

I believe Mr. Cheek is in error. The restriction on cellular capable or easily modified to be capable scanners only addressed those units manufactured or imported for sale. Thus the scanners would not in themselves be illegal nor would importing or building one for one's personal use be illegal. This distinction might be lost on a Customs person but if you read the act I think you will find it is true. OTOH using you scanner in a manner contrary to the ECPA is illegal unless of course you are a democrat.

Ouch! Nice scanner in its day, for sure. Ain't
hardly worth anything now except that it's one of
the cellular-capables. That's worth something,
I suppose, but how much? That's a personal
estimation and you don't have to reply.

Problem is....scanners are almost disposable these
days. But it costs a bunch to fix 'em. You figger
out what it's worth to you and then contact me
privately and I'll give you an idea of the costs
of repair. If the numbers match, then you're in
business. If not, what the heck.

Well, that is a good price.....

> the $299 if I bought the 5 year extended warranty.

How much did they soak you for the warranty?

> Next problem : Missing Antenna. The folks at RS
> threw an accessory antenna for the entire 25-1300Mhz range, with the
> required BNC angled connector and the cigarette adapter for teh DC
> supply --- all for $0.00.

That's a good deal.

> Now, since I am new to this I was wondering if I should have gone for the
> Trunk Tracker instead. The TT does not have the 900-1300 Mhz frequency
> range, so that is the trade off.

No, not "instead". And there are more tradeoffs. The 2042 has a
far superior receiver. You get 1000 channels, expandable to
16,000 or more. How's about ease of operation? How about
computer control? How about the capability for dozens more
mods and hacks? How's about user selectable MODE control?
The list just goes on....and on....

> Anyway let me know if its a deal worth keeping?

It is.

Grandfather clauses don't outlaw cell capable
scanners before April, 1994. I can't interpret
the law for after....... You'd need a lawyer.

> Is it illegal to own a cell modified pro-2006,

It sure would seem not. It's "grandfathered"....

> or to use it?

Use what? The cell capability? Yes, that's illegal.
Since 1986, no less.......

> Is it legal to modify a scanner to make it cell capable?

Apparently not for private owners. The FCC has said they
were coming after commercial concerns that did it, but not
individuals.

> Is it illegal to publish *how-to* ifo. on modifying scanners to
> make them cell capable?

You can publish information on how to make atom bombs.
Information, so far, has few if any legal constraints.

If memory serves, go do a Yahoo search for a program called etrunk.
It's somewhat similar to the trunker program; you will need a scanner
computer-controlled and a scanner with a discriminator tap. I think
there is also a data slicer you have to build. So far, at least this is
the only game in town insofar as EDACS is concerned.

I've dealt with Gerry at G&G Comm many times, and can say without hesitation that he is a godsend to the scanner user.

His prices are ALWAYS more then reasonable, and work is superb. He is a one man operation, working out of a shop in his house, and VERY popular in the scanning hobby. As such, his turn around time is a bit slow, but well worth it. gerry IS the service department!

For those folks looking to repair older scanners like a Pro-2004, of which parts are scarce, Gerry may be your only hope...

Dan

call 1800 the shack and ask for r.s.u. #10823334 it cost 23.29 and a three dollar shipping and handling charge.
ps it the same manual for the 2035 1000 channel scanner. the only difference is a chip .manual will indicate this.
a true radio shacking and scannist.

Just got it for a "trial period". Everything works. No Mods. A little
"scratchy" in the volume control, but the sound is ok.

I think I will offer $50 less and see what happens.

Thanks for the replys.

Wellllll, I dunno. I ain't a lawyer. But the FCC
interpreted the 1994 law to mean no changes of chips
or EEPROM programming, either. Turns out the AR-8000
needed only a new EEPROM or the old one reprogrammed, right?

> Perhaps the AOR 8000 was determinined not to be in compliance

Right. So far, the federales haven't focused on the
end users to speak of. They go for fatter pickings
at the dealer and importer level.

> But you are quite right that this is certainly a exception to the rule ...
> In general, scanners since 94 were not readily capable of cell restoration.

Yeah, I think it failed to meet the letter and the spirit
of the law all along, but it wasn't until last year when
Gingrich got snooped that the FCC tightened the screws.
Until then, not even cellular *mods* were questioned.

> without selectable step rate....SEE YA

Ummmmm.....errrrr....duhhhhhh, the US cellular
bands go in 30 kHz steps. And they won't go
15 kHz any time soon, and certainly not until
the existing analog system is obsolete. After
then, it won't matter anyway.

So a scanner that hops in 12.5 kHz increments is
going to be exactly on freq one-sixth of the time;
2.5, 5, 7.5, 10, and 12.5 kHz off freq for the
other five of six steps. Do the math.

Oh....and some scanners let you PICK the steps
you want.

Anyway, 12.5 kHz stepping for the cell bands is
sort of like taking a shower with a raincoat on.

No?

Wow. But there's two things wrong with that
picture. First of all, the cellular bands are
25 MHz wide. So yours is getting less than half
the channels. Back to the drawing boards!

Secondly, the cellular bands aren't on 902-912 MHz,
so you're hearing pseudosignals or "image interference".

> I have 2 modified units,

Modified? How? By a song? A dance? A hope? A Prayer?

5722. Acceptable tolerance for scanning error in PRO-67?

Newsgroup: rec.radio.scanner
Date: 1998-05-27 00:00:00 UTC
From: baf@texas.net
Message-ID: <MHTa1.623$hm1.637351@news.giganews.com>
Source record: 159351

I have a new PRO-67 scanner (thanks for advice and info from this group concerning its strengths and weaknesses before I bought it) which I use mainly in the 160-161 MHz band. Unlike my previous ("inferior") scanner I find it has a tendency to stop the scan at a programmed frequency (or railraod channel) just below the frequency on which the transmission is originating. For example, when the local transmission is at 160.320 (railroad channel 14), my scanner will stop at 160.305 (channel 13) and pick up badly distorted signals.

Questions -- Is that to be expected in modern scanners? Is there a simple adjustment to fix it? Is it a particular problem with the 67 or do I have an out-of-spec unit? Aside from locking out channels just below the frequently used channels, can I do anyhing about it?

The unit is still in warranty, but since RS has discontinued it, it may not be replaceable.

I'd appreciate any thoughts.

BAF

That mod is covered in a book by Bill Cheek, "The Ultimate Scanner". If you have a 2004, you need Bill`s other two books as well..."Scanner Modification Handbook" & Scanner Modification Handbook Volume 2". Just look for the CRB Research outlet nearest you.

Good Luck,

He is right on target......

It is called the CE-232 interface, excellent documentation in this kit. If you are handy at building projects with your soldering iron you can probably tackle it. If your not, not a problem, Commtronics has deals that include complete installation and testing, see the above web site.

I am almost done with mine and the verbose amount and quality of info was superb. It was better than the documentation I got with my opto-456 by a long shot. I have the 2006, but the CE-232 will work with the 2004 as well.

I will be able to tell you more about it, once it is up and running.

good luck!

Bob,

I use a Skyscan wideband outdoor antenna on my Yupi 7100 - it's pretty essential really. You will onlu overload it if there's a powerful transmitter next door. It is a very good scanner, a lot of people here in UK use them and usually say they are as good as the AR8k without the features. I read the whole of that thread you started because I am visiting the US in a couple of weeks and I want to bring my Yupi with me. No, I don't want to listen to drugs deals and radio phone-in contestants on 800Mhz like most of you guys seem to want to, but I would like to know what kind of hassle to expect from US customs.

Ken

Ken,

Unless you give them reasonable cause to search your bags, you should
have no problems taking the scanner with you into the US. A lot of people
in the US own a Yupi 7100 as well.

chuckiex@ibm.net (Charles McCallister) wrote:
> How do we figure out a fleetmap?

While I don't know of a simple or exact method of determining the fleet map of a Motorola trunk system (short of having a friendly system manager tell you), I've had fair sucess examining the IDs for the underlying pattern. While I use a computer link to log hit counts for all IDs over a day's span, you can do it by hand for a few hours and get a fairly good list. Likewise, I wrote a simple program to print the binary equivilents of the IDs but a calculator and patience can do the job.

Program the frequencies for the target system using the Type II default. Log all IDs that appear and keep a hit count for each, at least until you have three or four hits for an ID. If an ID occurs only once in a four hour span, it may be a false reading. Where you can determine it, note the user for an ID i.e. fire, sheriff, police, sanitation.

Sort the list in ascending order. Translate the decimal IDs that the TT reported into binary. If almost all the IDs end with the bit pattern "10000" you have a Type II system and no fleet map is required.
For a Type I or hybrid system, the first three of the 16 bits are the block number. The remaining 13 bits contain the fleet, subfleet and user ID. The challange is to determine how many bits are used for each element (the fleet number is omitted for blocks with size codes 4 and 12-14).

Split your list into blocks, based on the first 3 bits. For each block, look for ascending patterns in the low-order bits, followed by a sudden reversion to all zeros. The ascending numbers are probably user IDs within a subfleet. An increment in the higher bits at this point would indicate the next subfleet (or fleet) number. Scan the set of IDs for the block and decide what the logical grouping of bits is. For an example, an early log of block 2 for Fulton County, GA produced:

Group Blk Flt/Subflt/ID Usage

16640 010 0000100000000 Fire rescue
16643 010 0000100000011 EMS dispatch
20736 010 1000100000000 Sheriff - Patrol
20739 010 1000100000011 Sheriff
20819 010 1000101010011
20838 010 1000101100110
20912 010 1000110110000
20992 010 1001000000000 Sheriff - Tac 1
21504 010 1010000000000 Sheriff Courts
22784 010 1100100000000 Marshal Patrol
22819 010 1100100100011

22833 010 1100100110001
23040 010 1101000000000 Marshal Tac 1
23839 010 1110100011111 Marshal admin

There is clearly a break after the 8th bit, with the trailing eight
bits being user numbers (note the increasing series from 20736 thru 20912).
The change between 16643 and 20736 would indicate that only one bit is
used for the fleet number. Breaking the bit pattern at these points produces:

Group Blk F SubF user Type I ID

16640 010 0 0001 00000000 } 200-1
16643 010 0 0001 00000011 }
20736 010 1 0001 00000000]
20739 010 1 0001 00000011]
20819 010 1 0001 01010011] 201-1
20838 010 1 0001 01100110]
20912 010 1 0001 10110000]
20992 010 1 0010 00000000 201-2
21504 010 1 0100 00000000 201-4
22784 010 1 1001 00000000 }
22819 010 1 1001 00100011 } 201-9
22833 010 1 1001 00110001 }
23040 010 1 1010 00000000 201-10
23839 010 1 1101 00011111 201-13

This corresponds to size code 11. It's helpful to pencil-in on the Size
Code Chart the number of bits for each fleet & subfleet size.

While eyeballing the bit patterns may not give a clear idea of the
proper size code, it will eliminate most of the impossible choices and
reduce the testing to two or three possibilities for each block.

/* barry /&

(P.S. I should acknowledge that in Atlanta this is all academic; the
local fleet maps are built into the TT - thanks Greg <g>)

> general instructions?

On the Loop stick there is a Large coil and a small coil unwind the small
one if the local oscillator holds out and the front end IF lets some of the
higher frequencies through it will work. If there's more than one coil the
easiest way to find it is to tune a AM station and put your finger on one of the
coils and the one you put your finger on that drifts is the coil to unwind.
You really wouldn't be able to receive much on the Fm band because it is Fm
Wide and the band above 108 Mhz is in Am (aircraft).

For Sale:
OS535 Equipped Radio Shack PRO 2042 Scanner

Feature List:
PRO-2042
1000 Memory channels
AM/NFM/WFM
Hyperscan
50ch/sec
Sound Squelch
Tape Recorder Output
Switchable 10dB attenuiator

OptoScan 535
Full computer control of scanner
Fully Unblocked (800MHz)
CTCSS Decode
DCS Decode
DTMF Decode
100ch/sec Scan Speed
Unlimited memory channels
Discriminator Output
Reaction tune via Opto Scout

I will also transfer my license for Probe v4.0 software, and include
a registered copy of Scancat Gold for Windows Survelliance Edition.

All together at current purchace prices, this combo is worth over
$700.00!

I'm selling the pacakge deal, including shipping and COD (US only)
for $550.00obo

Everything is in perfect working order, and looks great as well.

Please e-mail me any questions as well as serious offers.

Please e-mail me at mwaldron@ohio.net.

01: What is the best scanner money can buy?

Your question is not answerable as it's phrased, because there are several classes of radios that are loosely called "scanners". A list of those classes or types is as follows:

A. World Class Receivers: arguably, this class of receivers includes radios from Icom, Kenwood, Yaesu, Alinco, Watkins-Johnson, and WiNRADiO. These are receivers ONLY, but by virtue of their cost, and/or excellence, and/or primary purpose, and/or technical design, and/or limited market distribution, I don't call them "scanners". They're good for a lot of the same things that scanners are good for, but they're still not 'scanners'.

B. Ham/Amateur Radios: includes all ham transceivers that have general coverage "scanning" receivers that cover any portion of the spectrum above and below 30 MHz. Despite the fact that these receivers can "scan", their primary appeal is to the ham radio community, and therefore aren't "scanners".

C. Scanners are receivers that are legally imported into and sold within the United States. Scanners that meet my definition of the word, cover at least 30 MHz and up, with memory scan, band search, priority, delay, and lockout functions, and which are widely marketed, either by mass-merchandizing or which are routinely advertised in a variety of radio and electronics related publications.

D: Foreign scanning receivers of the type included in (C) above and otherwise excluded from (A) and (B), and which are not certified by the FCC for importation and sale in the USA.

NOTE: I routinely support by bench testing, product reviews, and development of modifications only those receivers that meet my definition of 'scanners' as discussed in (C) above. While there may be an occasional exception, I do not deal to any appreciable extent with radios in any class other than (C). Therefore, when I render an opinion or a rating of a 'scanner', it applies exclusively to Category (C) and does not detract from or reflect upon receivers in Categories (A), (B, and (D). Here is why:

1. Category (A) is too expensive or too narrowly distributed or too specialized for the mainstream, typical hobbyist.

2. Category (B) is too specialized, both by specific interest communities and by law. That is, ham radios are solely for the amateur radio community, despite any appeal to other markets.

3. Category (D) is illegal in the USA for one, and two, it is very difficult or impossible to acquire service manuals and parts/repair support for receivers in this class. There is

little I can do to support these radios, so I usually just
ignore them, despite how "good" they may be.

4. My primary objective is to meet the technical needs of the
greatest number of hobbyists and to do the most possible
good and stay within the law.

==========
02: Okay. so what is the best real scanner money can buy?

Well, by the time I answer that, something new will come down
to make me a liar or change my mind. I don't have a simple
answer for that question, but let me try in so many words or
less. It's kind of complicated, you see. I am going to discuss a
handful of scanners that come close.

PRO-2004
========

My *favorite* scanner of all time is the PRO-2004, first
introduced by Radio Shack in late 1986. Its market life ended
in May, 1989, when the PRO-2005 replaced it. I like the PRO-2004
for its innovations, size, ease of operation and because nothing
like it has come out since. Here are some of its attributes and
characteristics:

Large, readable LCD display! AGC-controlled front-end
Sloping, tactile keypad! Seven bandpass filters
All- metal (shielded) case Double-balanced mixers
Large roomy interior Modularized with each major
Modern design, even though a mix of section on a separate board
wired and surface mount components Continuous coverage, 25-520 MHz
Easy to modify for added features & & 760-1300 MHz (after cell mod)
improved performance User-selectable AM/NFM/WFM modes
Good performance, anyway, right out User-selectable Search steps
of the box Lock-out Review
Triple-conversion Sound Squelch
400-channels, expandable to 25,600 Can be retrofitted for computer
or more! interface/control/data acquisition

I don't necessarily recommend the PRO-2004 for others anymore
because it is old now and Tandy no longer supports it with spare
parts and service manuals. You get one that fails and it just
might stay failed. Still....I think the PRO-2004 is the finest
scanner of all time, and I can fix 'em when mine break down.

For whatever it's worth, the PRO-2004 can be upgraded/modified to
include most of the specs of the PRO-2006.

PRO-2006
========

My next favorite scanner of all time is the PRO-2006, also from Radio Shack, that replaced the PRO-2005 in May, 1990. The 2006 is a slightly evolved and slightly downgraded version of the PRO-2004. You will see very few differences with the schematic diagrams held side by side. Essentially, they are siblings, and almost clones. But there are differences. The differences that I don't like include:

Smaller LCD display Smaller physical size/weight
Vertical, rubber button keypad Plastic case
Difficult access to CPU Board Condensed, congested main board
and LCD Display area

The differences that I like include the following:

Improved Squelch circuit Improved AM mode selectivity
Faster CPU (has additional AM IF filter)

The foregoing are pretty much the sum and total of the differences between the PRO-2004 and the PRO-2006. Unquestionably, the PRO-2006 is the better choice for most hobbyists because Tandy still supports the 2006 with spare parts and service. That, and the 2006 is probably more reliable and less prone to failure than the 2004. So MY personal preference for the 2004 is not in any sense of the word a recommendation. It is only my preference, and largely because I can service and maintain the unit. For those who can't do that, the PRO-2006 is the hands down winner.

The PRO-2006 had an active market life from May, 1990 to roughly April, 1994, when no more units were brought into the USA, thanks to the Act of Congress that outlawed "easily cellular modifiable" scanners. New PRO-2006's surfaced for about a year, thanks to a "grandfather clause" in the TDDRA of 1994, but by the end of 1994, they were pretty much all gone.

PRO-2005
========

The PRO-2005 replaced the PRO-2004 in May 1989, and was replaced by the PRO-2006 a year later in May, 1990. It had a very short market life, with good reason as we will see below.

This unit doesn't rank on my list of preferences. It's essentially a PRO-2004 without the goodies. It's identical in appearance to the newer PRO-2006, but retains the slower CPU of the PRO-2004. Gone are the large LCD display; metal cabinet; and sloping tactile keypad.

It's not that I dislike the PRO-2005 - it's a darn good radio in all respects. In fact, there are few differences among the PRO-2004/5/6, period. But when it comes to choices, the 2004 is my preferred and the 2006 is my second choice.

Aside from the physical appearances and redesign of the boards, the only difference between the PRO-2004 and 2005 is an improved AM-IF

selectivity in the 2005 by virtue of an added ceramic IF filter.

The short market life of the 2005, coupled with the improved and faster PRO-2006 puts the 2005 in a unique category. If you have one, enjoy it and keep it....it's a good radio. If you don't have one, then don't get one unless it's clean and cheap.

Interesting, but the PRO-2005 can be easily upgraded to a PRO-2006 in a couple of ways. The most feasible is to replace the CPU IC-501 and Clock Resonator CX-501 with the parts for a PRO-2006, and then rewire the keyboard diode matrix DA501-DA504, to agree with how they're wired in the PRO-2006. Voile! You've got a PRO-2006 for all intents and purposes. The Logic boards are otherwise the same between the PRO-2005 and 2006. And since Tandy still stocks parts for the PRO-2006, this seems a practical approach for an upgrade.

Another way to upgrade a PRO-2005 to a 2006 is to replace the Logic and CPU Board with one for a 2006....probably the easier way.... but last I knew, Tandy wouldn't sell whole boards to the public. So to replace the CPU and CLock Resonator and rewire the diode array remains the practical approach, I guess.

The only other significant difference between the PRO-2005 and 2006 is IC-10, a CMOS bilateral switch in the Squelch circuit. This can be easily retrofitted into the PRO-2005 to complete the upgrade. The back issues of the monthly WORLD SCANNER REPORT deal with this upgrade in detail.

NOTE: It is even possible to upgrade the PRO-2004 to a PRO-2006 by grafting a 2006 CPU and Clock resonator into the 2004's Logic Board. Trouble is, the PRO-2004 used a 64-pin DIP CPU while the PRO-2005/6 use a 72-pin surface mount CPU. Still, the pin functions of all three are identical, with one unused pin in the 2004's CPU and nine unused pins in the 2005 and 2006 CPUs. The 63 pin functions of all three CPUs are identical. And, in fact, I did successfully graft a 2006 CPU into one of my PRO-2004's, but it was a job that I don't know how to translate into words to tell others how to do it. If you are interested in converting your PRO-2004 to a PRO-2006, contact me privately and we'll see......

PRO-2042 and PRO-2035
==========

Would you believe these two fine radios are also clones of the PRO-2004/5/6 series? They are! Not exact clones, but mighty close! The PRO-2035/2042 don't have cellular capability, thanks to the TDDRA of 1994 that forbade "easy cellular modifications", and there is a whole new redesign of the boards and physical layouts, such that you'd need a schematic diagram to see all the similarities of these five radios. Still, the designs are very close, and as such, the PRO-2035/2042 rank up there on the list of my favorite radios.

The only significant differences between the PRO-2042 and the older PRO-2035 are in the firmware on board the CPU. The 2042 has more

conveniences than the 2035, but otherwise they are the same rig. Both are excellent radios if you can do without cellular coverage.

NOTES ON ALL FIVE RADIOS: PRO-2004/5/6 AND PRO-2035/2042
==========

All five of these rigs are capable of some hot-shot modifications, including many thousands of extra channels of Extended Memory and Search Banks. Literally, dozens of cool mods can be done to these five radios, and among my three books and eight years of the monthly WORLD SCANNER REPORT, these rigs are well covered.

The PRO-2004/5/6 are especially accommodating of the CE-232 Scanner/ Computer Interface, a smart 2-way RS-232 controller and data acquisition interface with legendary power and capability to make scanning easier and more fun. The CE-232 works in 1-way controller and AutoProgrammer mode with the PRO-2035 and 2042

PRO-43
======

Another member of the PRO-2004/5/6/203/2042 family is the handheld PRO-43. While the above five base scanners can be called 'siblings', the PRO-43 isn't, but it is a 'kissing cousin'. The PRO-43 shares enough of the circuitry and specs of the Big 5 that it is one of my favorite handheld scanners....perhaps THE favorite. It is the only Radio Shack handheld scanner to ever come with the military aero band. That alone is pretty awesome.

The PRO-43 is capable of many mods and hacks, including continuous coverage from about 8 MHz to 1 GHz. Yes, shortwave! Not that it works very good down that low, but the mod does unleash the force. The PRO-43 is a very cool radio and certainly the last of its kind. There are newer and snazzier handhelds out and about, but when it comes to more steak and less sizzle, the PRO-43 is hard to beat.

The PRO-43 works with the CE-232 Scanner/Computer Interface in 1-way controller and AutoProgrammer mode.

PRO-64 and PRO-2041
==========

The PRO-64 (handheld) and PRO-2041 (base) are electronic clones of each other, (electronically identical) and what I would call 'second cousins' to the family of the PRO-2004/5/6/2035/2042 and a first cousin of the PRO-43.

Good as these scanners are, they're even better when you consider that they come with a built in computer interface. Five bucks worth of parts and a free program lets you program these scanners with 400 channels of frequencies in about 45-seconds! Now ain't that slick!

The PRO-64 and PRO-2041 are well covered in the monthly WORLD SCANNER REPORT, where we've found these two rigs to be eminently

hackable and modifiable.

PRO-26 and BC-3000XLT
=====================

There is no relationship of the PRO-26 and BC-3000XLT to the family of the PRO-2004/5/6/203/2042/43/64/2041. That "family" was made by GRE-Japan while the PRO-26 and BC-3000XLT were made by Uniden in Taiwan. The PRO-26 and BC-3000XLT are close clones of each other, however. They are not identical, but you'd have to study their schematic diagrams for a while to spot the differences. For all practical purposes, they are alike.

Some say the BC-3000 is a little better than the PRO-26, but that's not cut and dried. These two radios are great performers and have excellent potential for mods and hacks. Forget cellular; it ain't going to happen shy of the low-rent "VD" mod or replacement of their CPUs with European versions. Neither of these so-called cell mods are acceptable in my books and they all cost a lot of money, time, and trouble for sub-par results. <Gack>

UNIDEN SCANNERS
===============

Uniden is best known for selling lots of sizzle and not so much steak. Generally speaking, especially in their base scanner line, you buy software more so than hardware. All radios nowadays are microprocessor and firmware based, but Uniden takes this concept to the ultramax! Software is cheap compared to hardware. Not since the Muntz TV's of the 1960's have I seen such sparkling, glittering chassis on the outside and near vacuums on the inside.

Uniden has made some good radios in their time, including the BC-200XLT, BC-205XLT, BC-3000XLT, and the PRO-26. The common factor here is that these four are handheld scanners. Uniden seems incapable or unwilling to make comparable quality base scanners, though their latest offering of the BC-9000XLT might well be a sleeper. At least, it comes with more firmware frills and sizzle than any prior offering.

In general, I don't recommend Uniden scanners. Read my lips now; I don't advise against them....I just don't whoop them up. I'm not comfortable with their marketing tricks and hype. Uniden goes after the masses with a hokey glitz and glamor, the price of which is included in the cost of the scanner. You end up buying software, sizzle, glitz, and glamor. In my opinion, the "steak" is tough and you don't get much.

As usual, there are exceptions.....

THE TRUNKTRACKER SCANNERS
=========================

So far, Uniden is the only manufacturer so far of TrunkTracker scanners, including the PRO-90, BC-235XLT, BC-895XLT, and now, the PRO-2050. The PRO-90 and BC-235XLT are identical clones and the new PRO-2050 in a base package might well be a clone of these two. The PRO-2050 is not a clone of the BC-895XLT, despite both being base scanners.

I'll have to hand it to Uniden on their TrunkTrackers. The TT radios seem to be a fair mix of sizzle and steak, and they certainly do track the Motorola trunked systems. The BC-895XLT may even be computer controllable though Uniden doesn't support it, but I hear that 3rd parties may be offering control software for it.

Basically, I'm not sold on this first generation of TrunkTrackers, despite the fact that they work and the public seems to have accepted them. I'll tip my hat, that's for sure, but I'm all for waiting to see what GRE-Japan comes up with. And we all know that "Version 1.0" of anything these days isn't the best that can be done. So I am waiting for the competition to gear up and/or for the 2nd generation of TrunkTrackers to come.

Someone has to buy into the first generations of new stuff. If you are so disposed, you won't get any argument from me. If you have a conservative "wait and see" attitude, you'll find me in your company.

AOR SCANNERS
============

AOR seems not want to sell very many scanners in the USA. They have a yo-yo, switchy-swatchy pattern to their marketing and technical support. Their service manuals are both expensive and deplorable. AOR seems to serve a cultist, elitist, niche scanning community. Despite that their top of the line radios might well be second to none, I just don't support them.

If you have an AOR scanner and like it, I can understand why. But you are a minority and AOR apparently doesn't want to do anything about it. I prefer to serve the majority, and so there is little more I can say about AOR scanners.

NEW PLAYERS IN THE SCANNER GAME
===============================

Relm and Sony are new players on the scanner scene. I don't know anything about these rigs yet; the Sony is much too new, and the Relm just doesn't have much of a market penetration yet. People say it's a good radio; maybe they're right, and maybe they're just defending the wisdom of their purchase. I think both are doomed to bit-player and niche status, but time will tell.

Meanwhile, with rare exception, I give my stamp of recommendation only to those radios that have withstood the test of time. The johnny-come-lately's may well be good scanners, but if that's true,

then they will pass the test of time. AOR's AR-8000 is one such example. It's been around for some time and continues to do well despite a more advanced model recently announced.

YUPITERU SCANNERS
==========

It is illegal to import "Yupi" scanners into the USA, because they are not certified by the FCC for sale here. Furthermore, Yupiteru seems to not give a whit about the US market, so why should I give a hoot about them? There is also the question about sending good USA money to markets that do not return some benefits to our community.

Not only that, but service and support for Yupiteru radios are either nonexistent or at best, 3000 miles away. However, you can't get a service manual for these scanners. You buy a Yupi and you risk running afoul of the law; as well as having dead meat on your hands should the unit ever fail.

Some people claim the Yupi radios are the best they've ever used. I hear little of anything bad about them. So the issues you have to deal with are patriotic ones, and those of service and support, and last, but not least, legal issues. So far, no one's been nailed for importing a Yupi scanner, but somewhere, someday, someone's going to be the first. Could it be you?

WORLD CLASS RADIOS
==========

There is a class of radio, not properly called a scanner, but without a name or a home anywhere else. I call them "world class radios" for lack of a better term. These include wide coverage receivers from Icom, Kenwood, and Yaesu.

Kenwood and Yaesu seem to have slithered out of this market realm, leaving Icom pretty much uncontested at this time. Kenwood's RZ-1 and Yaesu's FRG-9600 are much too old to be real competition now, but these are classics, and if you can snag one cheap, you may have a deal that's worth it.

Icom has a number of entries in this class, including the R-9000, R-7000, R-7100, R-10, R-1, etc. I don't count these rigs in my recommended lists because they really don't fill the defintion of "scanner" in the important ssense of the word, and their cost is way out of proportion to scanners as we know them. Most of these rigs certainly qualify as "great" radios, but they are not scanners.

COMPUTER-BASED RADIOS
==========

A new class of radio has recently emerged....computer-based receivers, of which there are two: Icom's PCR-1000 and the WiNRADiO WR-1000i. This class of radio is characterized by their

total worthlessness without a computer. These radios depend on a computer as an integral part of the operation.

Several new and upgraded versions of WiNRDiO have been announced, and will be coming to market soon. Icom apparently isn't going to announce anything new until well into 1999

The PCR-1000 follows Icom's tradition of speed. If it weren't so slow, it would have no speed at all. It's slower than a slug. But it does go portable by virtue of operation and control from an RS-232 serial port. And it does have some impressive technical specs for its coverage of LF into UHF. A little pricey, the PCR-1000 has made its mark and its loyal users appear to be satisfied with it in most respects aside from speed (or the lack thereof...)

WiNRADiO Model WR-1000i cruises at 50-cps, and along with its standard RF Spectrum Scope and optional Digital Suite, is probably the better buy at a price significantly lower than the PCR-1000, and with a very powerful control program that's regularly updated and released FREE to downloaders.

The WR-1000i covers 500 kHz to 1300 MHz, less cellular, but there are ways to deal with that. I can't tell you how, but if you look around, you should discover it.

The specs for the Icom PCR-1000 and WiNRADiO WR-1000i are easily examined at the companies' Web sites, so I'll dispense with pitting one against the other. Both are great radios, but if you are undecided, you really need to do some homework and not take anyone's word for validating your decision. The Icom loyalists are too anxious to defend their choicess while WiNRADiO just doesn't have a lot of market penetration yet.

Still, my choice is for the WiNRADiO, maybe because the hardware and software are undergoing constant upward revision and the company is very responsive to its customers. Just send them an e-mail and see for yourself. Then send Icom an e-mail...if you can.

WiNRADiO has a high-end model, the WR-3000i, that isn't certified for sale in the USA. That, and its $2000 price tag make it pointless to discuss it here, but some people have come by one and speak highly of its awesome capabilities, including visual DSP!

SUMMARY: As you can see, I really can't recommend a "best radio for the money". I have my preferences, and I told you about them. Take 'em with a grain of salt, or take 'em to the bank, I don't care. What matters more is that you be exposed to a diversity of thought and opinion. I am not a "company man" who minces words and wonders why we all can't get along. I deal in straight shooting and am happy to leave it to future generations to figure out why we all can't get along.

Meanwhile, try to understand the differences between the various classes of radios and even the differences between manufacturers before choosing the radio of your dreams. All too often, the best today is not the best tomorrow, or the best up front is not the best overall. Maybe there is no single "best". For a fact, many scannists nowadays own and operate two or more radios.

One thing to keep in mind...or get in mind....is that the entire face and nature of radio are changing, from the politics to the technology to the very content. What was good for and applied to radio of yesteryear is not good for or applicable to radio of tomorrow. Change is apparent everywhere. Be aware of those changes and learn how to cope with them and how to go with the flow.

There is less to listen to these days and I don't see that trend changing any time soon. It's only going to get "worse" as more and more radio services see the economics and privacy of cellular, PCS, and other means of digital communications.

But these very changes mean new opportunities in the offing. One example is how for many years, it took an expensive, sophisticated 3rd party instrument to decode RTTY, FAX, and CW. Now a couple bucks worth of parts and some free software do all that and much more. (See my Scanner Data Decoder FAQ or SCANDATA.FAQ.) There may be less to listen to, but there sure is more to decode.

==========

That's it for now. I will keep this FAQ updated. If you see things that need to be added to it, by all means, let me know. If this FAQ fails to address your question(s), then hit me with 'em again, but be specific. And be detailed with symptoms and observations if you need tech support on mods or troubleshooting and diagnosis. Use e-mail if you can.

Bill Cheek's S-Meters for Scanners
Frequently Asked Questions File
==========

Contents
==========

01: My CB, Ham, and SWL radios all have S-meters. Why not my scanners?
02: How can I add an S-Meter to my scanner?
03: How about an S-Meter for the PRO-26?

Questions and Answers
==========
01: My CB, Ham, and SWL radios all have S-meters. Why not my scanners?

Derned if I know. My guess is that the superficial reason is one of sheer economics. S-meters add to the cost of the radio. Deep down, I suspect that the majority scanner market consists of homebodies, yuppies, and couch potatoes who really don't know an S-Meter from a speedometer, and who wouldn't appreciate one if they had it. So the manufacturers don't provide S-meters on any but the top end scanners.

An S-meter can be added to many scanners, though. <grin>

==========
02: How can I add an S-Meter to my scanner?

Some scanners, notably most Unidens will require a procedure that I haven't written and fully tested, so all I can tell you about right now is how to do it to certain kinds of scanners, notably those manufactured by GRE-Japan for Radio Shack. This technique might apply to Uniden and other scanners, but I can't say for sure at the moment. Read on and maybe you can find out for yourself.

HIGH PERFORMANCE S-METER FOR THE
PRO-2006/5/4/3/2 PRO-2035/2042
PRO-2041/2032/2027/2024/2022/2021/2020
PRO-64/62/44/43/39/37/36/34/32
and possibly other scanners with the 108-136 MHz Aero Band
Revised April 30, 1998

==========
PRELIMINARY NOTE: This article is self-contained and you really don't need any other supporting materials other than the service manual for your scanner. Bear in mind, however, that only so much detail can be in an ASCII text file like this. If you want more detail than offered here, a hard-copy laser printed version of this article, complete with professionally rendered graphics is available for US$5.00, ppd. See my sig box at the end of this article for addresses, phone numbers, etc.
==========

INTRODUCTION:

What is an "S-Meter"? Well, it stands for "signal meter" and is used to provide an "RSL" (received signal level) indication of the strength of the incoming signal. Analog S-Meters are all calibrated pretty much in the same fashion with two scales. The first 2/3 of the metering range is calibrated in "S-units", a fairly linear scale of 0-9. The units are read as S1, S5, S9, etc. S9 is the calibration point, generally meaning a signal at that strength is 100-microvolts, but manufacturers sometimes use 25-uV or 50-uV as the reference for S9 signals.

The relative signal difference between S-units is typically 6 dB per S-unit, between S0 and S9, but in practice this can vary widely, from as

little as 3 dB per S-unit to 7 or 8 dB per S-unit. Unless you know different, it's okay to figure 6 dB of RF change between S-units 0-9.

The last 1/3 of the scale is calibrated in decibels (dB) over S9 and is, of course, a logarithmic scale, typically in three 10 dB sections though some meters go to 60 dB over S9.

Digital S-Meters, including LED bargraphs may or may not follow any standard scale of calibration. Typically, LED bargraph displays are good only for relative indications or comparisons of one signal to another; "before and after" situations, etc.

Up to this point, you may think that S-Meters are useful only for measuring the relative strength of incoming signals, but think about it for a minute. What determines the strength of signals going into your receiver? More specifically, what factors are under YOUR control that determine received signal levels? I can think of at least four things right off: antenna type; antenna height; coaxial cable quality and length; and the correctness or precision of the receiver's electronic alignment (internal adjustments).

Therefore, there are a number of things you can do around your monitoring post that will affect the strength of received signals. Wouldn't it be nice to know if something you did had a beneficial or harmful effect? Sure! That's one powerful use for an S-Meter.

As an example, say you want to change out your coax cable and want to be sure the new stuff is better than the old. So first tune to a known consistent signal such as a NOAA weather station or perhaps an 800 MHz control data signal. Write down the S-meter reading. Then change out the coax (or elevate the antenna, etc). Then write down the new S-meter reading and compare the two. You'll know if you did right or wrong.

Many scanners are capable of supporting an easy to build and install S-Meter! Most Realistic scanners made by GRE-Japan with the civilian aero band, 108-136 MHz, can support this low cost, high performance S-Meter modification.

It takes special circuitry for a scanner to receive Amplitude Modulated (AM) signals because AM is an uncommon mode in the VHF/UHF spectrum. In fact, AM is used pretty much exclusively for civilian aircraft comms on 108-136 MHz and military aero comms on 225-400 MHz. Most scanner signals are Narrow FM (NFM). Wide FM (WFM) is used in the FM Broadcast band, 88-108 MHz, TV audio signals; and studio-transmitter-links. Everything else is pretty much NFM.

Therefore, most scanners are designed strictly with NFM in mind, and will not have either AM or WFM capability except as a costlier extra feature. That's why you pay more for scanners that have the civilian aero band, and more still for those with the military aero band.

If your Realistic scanner has the AM mode, and it will, if it has the civilian aero band, then chances are good that we can take advantage of

its extra circuitry to add the simple, low cost S-metering function.

Scanners known or strongly thought to be capable of this easy S-Meter mod include the following listed in Table 1:

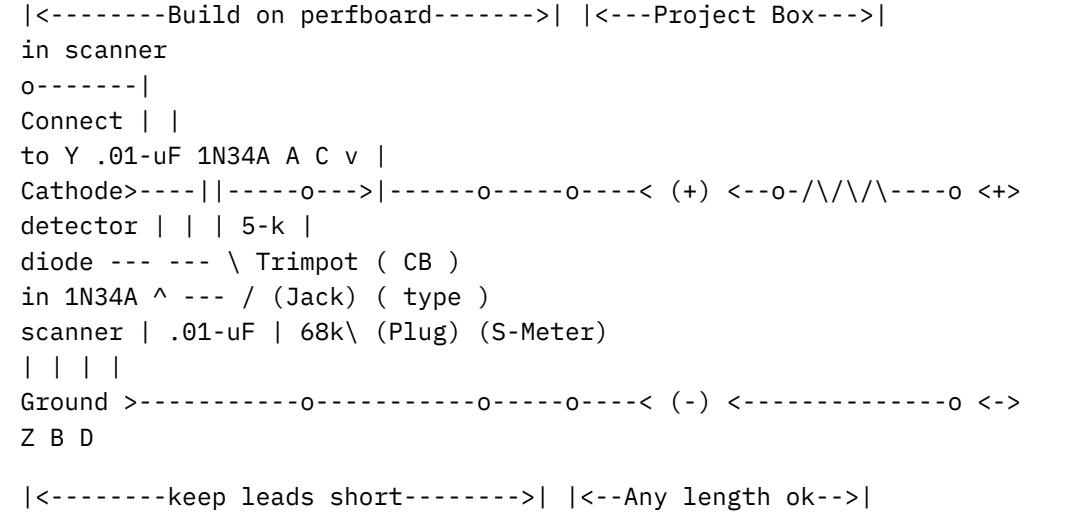
TABLE 1: COMPATIBLE SCANNERS FOR THIS S-METER MOD

PRO-2042 PRO-2027 PRO-39
PRO-2035 PRO-2024 PRO-37
PRO-2032 PRO-2022 PRO-36
PRO-2006 PRO-2021 PRO-34
PRO-2005 PRO-2020 PRO-32
PRO-2004 PRO-62 PRO-64
PRO-2003 PRO-44 PRO-2041
PRO-2002 PRO-43

CAVEAT: Many of Radio Shack's later scanners are made by Uniden, the design of which leaves so much to be desired that this version of the S-Meter is probably not feasible. There may be other alternatives but are beyond the scope of this document.

If your scanner is not listed in Table 1, the best way to determine applicability of this procedure to your scanner is to review the main schematic diagram for your receiver section, and compare it to the circuit of IC-2, Q-12, Q-13, and D-33 of the PRO-2006. This circuit is used in all the above compatible scanners, and is required for this version of my S-Meter mod. Specifically, you will look for the NFM chip and AM detector diode shown in Table 2 further below.

The AM section of the PRO-2006 is almost identical to the AM circuits for the scanners listed in Table 1. Each of these scanners takes its AM signal from the output of the 455 kHz IF filter that's attached to the NFM Discriminator chip. Part of the IF signal goes back into the NFM chip for NFM signals as needed. The other leg of this "Y" is that part of the signal that goes on to a separate AM processor. The key thing here is that both circuits are used full time. Special switch circuits do the controlling of which mode is actually in use, but the circuits are still on full-time. That's why we are able to use the AM circuit to power our S-Meter



The key point here is that you must identify and use the cathode of the AM Detector Diode as the pick off point for your S-Meter signal. If your scanner is capable of this mod, it will have an AM circuit almost identical to that of the PRO-2006. Find it, and then locate the AM detector diode. The diode's banded end is the cathode where the S-Meter signal will be tapped. NOTE: The PRO-2041 and PRO-64 are exceptions that don't use a diode as an AM detector. These use IC-302 and some experimentation is in order to determine the applicability of this S-Meter modification.

For base scanners, build the simple circuit in Fig-1 on a bit of perfboard. For handheld scanners where space is at a premium, it may be best to not use a board, and just build the circuit of Fig-1 directly

into the scanner, part by part. Start by soldering C1 to the cathode of the AM detector diode, and the anode of D1 to a handy ground. Then build the rest of the circuit around those two components. Following is Fig-1, the schematic of the S-Meter circuit.

Build the following simple circuit left of Points A and B on a piece of perfboard. The circuit to the right of A and B is optional, explained further below.

FIGURE 1: SCHEMATIC DIAGRAMS

THE PARTS: Radio Shack stocks the parts shown in Fig-1 except for the S-Meter. Diodes must be germanium, 1N34A or 1N60. Capacitors should be ceramic disks. Resistor (56k-100k) and trim-pot (3k-10k) are not critical. The circuit of Fig-1 must be as shown. If you use an external CB-type S-meter, so much the better....just build the meter of choice into an attractive or functional project box with a cable of any length from the box to Points C and D which should be wired to a male phono plug of some sort.

Most any analog CB-type S-Meter is ideal for this project, but the larger the face, the more readable it will be. There are thousands of junked CB rigs all over the planet, and most any CB or radio shop will have a bin full of them. The cost of a salvaged S-Meter should be negligible.

The scanner should have a mating female jack connected to Points A & B, installed in an out-of-the-way place for the plug from the external meter.

Keep the Point Y lead length very short, not more than an inch.

Connect Point Z to scanner PCB or chassis ground and keep that lead short, not more than 1 inch.

Connect Point Y of the S-Meter circuit via a very short wire to the cathode of:

TABLE 2: CONNECTION POINTS IN VARIOUS SCANNERS

SCANNER	DETECTOR	AM -at or near- NFM CHIP
PRO-2042:	D-34	TK-10420
PRO-2041	IC-302	Try Pin 11 or 5 *
PRO-2035:	D-34	TK-10420
PRO-2032:	D-23	TK-10420
PRO-2006:	D-33	TK-10420
PRO-2005:	D-33	TK-10420
PRO-2004:	D-31	TK-10420
PRO-2003:	D-122	MC-3357P
PRO-2002:	D-119	MC-3357P
PRO-2027:	D-24	MC-3361N
PRO-2024:	D-24	MC-3361N
PRO-2022:	D-29	MC-3361N
PRO-2021:	D-24	TK-10420
PRO-2020:	D-120	MC-3357P
PRO-64:	IC-302	Try Pin 11 or 5 *
PRO-62:	D-302	MC-3361N
PRO-44:	D-202	MC-3361N
PRO-43:	D-302	TK-10420 or 10427
PRO-39:	D-202	MC-3361N
PRO-37:	D-122	TK-10420
PRO-36:	D-114	TK-10420
PRO-34:	D-117	TK-10420
PRO-32:	D-122	TK-10420

* Not certain - needs more experimenting

Other Scanners: This mod may work with other scanners that have the civilian aero band of 108-136 MHz. If your scanner has 108-136 MHz and is not listed above, then find the last 455 kHz IF section, and locate the AM detector. Connect Point Y to the cathode or IF-side of the AM detector diode.

CAVEAT: Some scanners turn off the AM section when in the NFM or WFM mode and some don't. If yours doesn't, you're "fat". If the AM section is turned off, you'll have to modify the switching circuits to leave the AM section on, but not feeding the audio preamplifier. Examples of scanners that need no AM switch section modification include the PRO-2004, PRO-2005, PRO-2006, PRO-2035, PRO-2042, PRO-43 and there may well be others. A little experimentation will tell for sure. Use your voltmeter while switching modes.....

==========

NOTE: While this mod probably won't work with Uniden scanners nor Radio Shack scanners made by Uniden, a little R&D and experimenting on a Uniden aero-band scanner could prove successful. I don't own any Uniden scanners, but can assist you in your R&D if and only if you and I both have a copy of the service manual for your scanner. Contact me by e-mail if interested.

==========

WRAP-UP DETAILS: Points A and B are the metering points where any DC voltmeter can be used. S-Meter signal range will be about 0-1v. The circuit of C and D is an optional CB type S-Meter, and should be used external to the scanner. Therefore, it is ideal to wire A and B (length not critical) to a phono jack on the rear panel of the scanner for easy connection of the external meter. Use 1/8" or RCA phone jacks for base scanners and 3/32" submini phone jacks for handhelds.

METER CALIBRATION: Any DC voltmeter can be used directly at A and B including a bargraph LED display. If an external S-meter circuit is desired, then wire it as shown. Use a walkie talkie or other transmitter to send a strong signal into the scanner, and adjust the trimpot so that the meter reads exactly full scale. All other signals will then read proportionally lower. Too cool for words!

METER LIGHTING: You can embellish your S-Meter with a small pilot lamp behind it to illuminate the face. Many CB meters have such a lamp built into the body of the meter. You may have to tap 12-volts or other power from the scanner for the lamp, or provide external power, like for handhelds.

SUPPORT: I do not supply S-meters. I can provide other parts including printed circuit boards, assembled or as a kit. I will provide technical support of this project on the public network forums and/or by e-mail; never by phone. See the beginning of this article if you need a hard copy version of this article.

MOD BOARD INSTALLATION HINTS: Most modification circuit boards really need no special effort in the mechanical installation. I used to use fancy standoffs, bushings, and machine screws, nuts, and bolts, but no more, considering all my mods!

Now I loop a stiff #18-ga copper wire (RS# 278-1217) through a pair of ground holes in my perfboard or printed circuit; solder it securely to the board; and then solder it to a ground on the main board.

I solder the #18-ga wire to a chassis sidewall, or in some cases, to a ground foil on the main receiver board. This mount is rigid, safe, and easy, not only to install, but also to remove if needed. A "glop" of hot-glue on the bottom of the mod board prevents accidental shorts below it.

Enjoy S-metering at its finest!

==========
03: How about an S-Meter for the PRO-26? (and BC-3000XLT?)

Okay, this one is different from the above scanners, but since an S-Meter is already "built in" for the most part, I'll clue you to what little else you have to do.

A. Locate IC-14, Pin 16.
B. Run a wire from IC-14, Pin-16 to a handy jack mounted on
the side or back of the scanner.

C. Run a wire from any scanner/PCB ground to the jack mentioned
in Step (B).

D. Solder the wire from IC-14, Pin 16 to the center or hot lug
of the jack.

E. Solder the ground wire (Step C) to the shell or outer lug of
the jack.

F. Button up the scanner.

G. Build the external S-Meter from Figure 1 (above) exactly as shown
under the "Project Box" (right half of the diagram).

H. Connect the S-Meter to the jack and calibrate it according to
the instructions for the S-Meters in Question 02.

NOTE: This S-Meter works for the NFM and AM modes only; not WFM.
A separate circuit altogether is needed for a WFM S-Meter.
I may add it to this FAQ later, so inquire if you just have
to have it.

==========

That's it for now. I will keep this FAQ updated. If you see things
that need to be added to it, by all means, let me know. If this FAQ
fails to address your question(s), then hit me with 'em again, but be
specific. And be detailed with symptoms and observations if you need
tech support on mods or troubleshooting and diagnosis. Use e-mail if
you can.

Bill Cheek's Scanner Data Decoding
Frequently Asked Questions File
==========

Contents
==========

01: What is a 'Discriminator Output' and 'baseband audio'?
02: How can I find the Discriminator Output in my scanner?
03: How do I connect to the Discriminator Output?
04: How do I build a decoder interface circuit?

05: So how do I decode digital data from the airwaves?

Questions and Answers
==========
01: What is a 'Discriminator Output' and 'baseband audio'?

There is a growing interest in tapping the baseband audio
out of various scanners for decoding of a variety of esoteric
signals, including CTCSS, SCA, FSK, RTTY, FAX, Pager data, and
trunked system control data, etc. By and large, such signals cannot be
taken from TAPE REC jacks, headphone jacks, and EXT SPEAKER jacks
because of the voice-band filters that are between the signal
source and these output jacks.

Therefore, it is necessary to tap the "baseband audio" directly
at the output of the discriminator chip for your scanner.

==========
02: How can I find the Discriminator Output in my scanner?

Table 1 shows a list of scanners, the discriminator chip(s) used in the
scanner, circuit symbols of those chips, and the baseband audio
(discriminator output) pin.

If your scanner isn't listed in Table 1, then refer to Table 2 to find
its discriminator chip. The chips listed in Table 2 are all known
Discriminators used in scanners and wide coverage receivers.

Between Tables 1 and 2, you should be able to find the discriminator and
its output pin for any reasonably modern scanner.

Corrections and additions to these lists are requested. See my
email and other addresses at the end of this file.

Once you locate the discriminator in your scanner, you have to make its output conveniently available on the exterior chassis, much like a headphone or tape recorder jack.

==========
03: How do I connect to the Discriminator Output?

HOOKUP PROCEDURE
==========

If you need the raw Discriminator baseband audio signal for external purposes, the best way to access it is via a jack installed in a convenient, unobtrusive location on the scanner.

1A BASE SCANNERS: Install an RCA or other jack in a desired place on the scanner's external case, typically the rear panel.

1B HANDHELD SCANNERS: If you can find the space, use a standard monaural 1/8" phone jack or a 3/32" mini phone jack. Some scanner are so cramped inside that even these won't fit. In that case a strip of 3 pinline sockets can be melted into the plastic case and wires soldered to the inside protrusions. The middle pinline socket is not connected to anything; it's just there as strength and support for the pinline plug you make, with the shield ground soldered to one end and the audio-center soldered to the other end: GND---o o o---NFM DSCR (audio)

"Break-apart" pinline plugs/sockets are available from Mouser, DigiKey, and Hosfelt. These little puppies are good for a lot of hacker needs, so get a supply!

2. Connect the shell or outer frame part of the jack to scanner chassis ground. (Use one end socket for pinline connections)

3. Connect the (+) leg of a 2.2-uF to 4.7-uF tantalum capacitor to the Discriminator output Pin. (Capacitor should be tantalum, but can vary in value from 1.0-uF to 10-uF at a voltage rating of 16-35 vdc.)

4. Connect the center conductor of a shielded coax (RG-174, etc)
or shielded mic cable to the (-) leg of the capacitor. NOTE:
if the distance from the NFM tap to the jack is less than 3",
then a single unshielded hookup wire will do fine.

5. Connect the shield of the cable at this end to a nearby PCB
ground trace or spot.

6. Connect the center conductor of the other end of this cable
(or single hookup wire) to the center or hot lug of the jack.

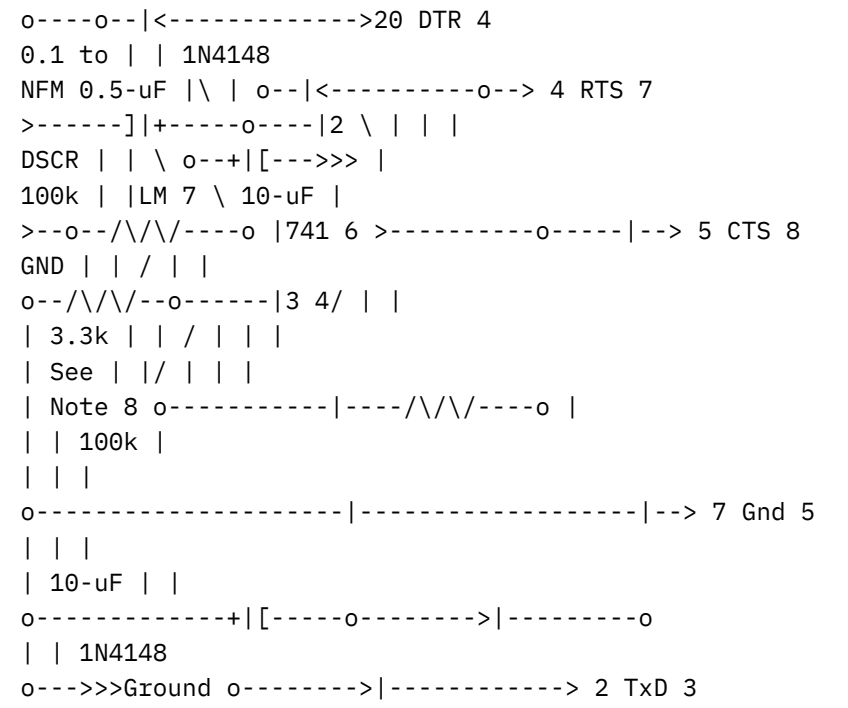
7. Connect the shield of the cable at that end to the ground lug
of the jack.

8. Fabricate or buy a shielded patch cable with one end to mate
with the new jack on the rear of the scanner at that end....and
the other end to mate with whatever jack is on the tape recorder,
processor, decoder, or whatever device is to be connected at the
other end.

Now you are ready to connect a data decoder interface to the baseband
audio output jack.

==========
04: How do I build or acquire a decoder interface circuit?

If you want to decode trunk control, MDT, pager, fax or other
digital signals, you will need to build or buy a simple Interface to go
between the NFM Discriminator/baseband audio of the scanner and the PC's
serial port.



If you are not capable of building your own, or if you don't have the
time to mess with it, I can supply an assembled/tested Decoder
Interface, built inside a DB-25 shell and connector with a 2-to-3 ft
shielded cable terminated with an RCA plug, for US$35 plus $5 S&H
domestic. See my signature box at the end of this article.

The DB-25 shell connects directly to a DB-25 comport on the PC, or, if
your comports are DB-9's, you can get a DB25-to-DB9 adapter for it. You
should, however, be able to make your own following the below
instructions.

This is a tried and true Data Interface circuit that is good for
everything we've tried, including a wide variety of scanners. External
power is not required. This circuit draws its power from the comport.
It is similar to the "Hamcomm" and "data slicer" interfaces, but is
optimized for more scanners and more applications.

	1N4148
o--->>>Ground o-------->|------------> 2 TxD 3

LEGEND:
o = soldered connection/junction
--|-- = crossover (no connection)
+|[= capacitor, polarized (see +)
>| = diode (anode->|-cathode)
|< = diode (cathode-|<-anode)
-/\/\/- = resistor
-->>> = ground

NOTES:
1. Use tantalum capacitors, +|[polarity as shown

2. Radio Shack's LM-741 works fine. Others might not!

3. Use 1/4 or 1/8 watt resistors to save space

4. Build circuit on a trimmed and fitted piece of perf board inside a DB-25 shell for max efficiency and space savings. DB-25 connects to PC's comport and a shielded cable from the scanner goes to the input; shield is ground and center is audio.

5. Many handheld scanners have no space to install a phone jack for the NFM Discriminator Output. For such tight spaces a strip of 3 pinline sockets can be melted into the plastic case and wires soldered to the inside protrusions. The middle pinline socket is not connected to anything; it's just there as strength and support for the pinline plug you make, with the shield ground soldered to one end and the audio-center soldered to the other end:

GND---o o o---NFM DSCR (audio)

6. For base scanners, install a female RCA jack on rear panel.

7. For handheld scanners where there is space, use a 3/32"
mini or a 1/8" standard monaural phone plug.

8. 3.3k is an optimized value for most applications. If the
baseband audio output is less than 400-mV AC, you can
decrease the 3.3k resistor to 2.2k or even 1k if needed.

9. Connect the interface to a comport on the PC. Plug the
input cable in to the scanner's NFM Discriminator Output
Jack. Tune to a desired signal and run the decoder
software of your choice.

==========
05: So how do I decode digital data from the airwaves?

First, you tap the Discriminator Output in your scanner. Then build the Decoder Interface and connect it to the Discriminator Output. Then connect the other side of the Decoder Interface to a com/serial port on your PC. Lastly, run the software that decodes the particular type of signal that you want to decode.

In general, it takes different software for different kinds of signals, and I can't possibly cover them all here. I will suggest that you start out with a free program called TRUNKER that decodes the control data of Motorola trunking systems. This is one of the easiest to set up and get working; therefore, it makes a good test "platform" to prove up all your work before you venture into bigger and better things. Motorola trunk systems are fairly common now.

TRUNKER and a good set of documentation and limited support for it can be found at the following URL (Web Site):

http://www.geocities.com/CapeCanaveral/Lab/1060/beta.htm

==========

That's it for now. I will keep this FAQ updated. If you see things that need to be added to it, by all means, let me know. If this FAQ fails to address your question(s), then hit me with 'em again, but be specific. And be detailed with symptoms and observations if you need tech support on mods or troubleshooting and diagnosis. Use e-mail if you can.

B (No@ne.none) wrote:
: Just got it for a "trial period". Everything works. No Mods. A little
: "scratchy" in the volume control, but the sound is ok.

The scratchy volume control can probably be fixed with a bit of contact cleaner.
Before you even do that, try spinning the control from end to end quickly 20 or 30 times-this MIGHT clean it enough!
Also, the control is probably still available, if you can't get the noise out(unlikely).

as for mods....the 2 most common ones are
1.adding 100 channels(the 2004 is actually a 400 channel scanner, although "out-of-the-box" it THINKS that it is a 300 channel unit-the mod is a "add-a-diode" mod
2.unblocking the CMT freqs-this is a "remove-a-diode" mod.
In fact, I seem to remember that you could take the diode that gets removed in 2, and use it for 1.
Speed up mods used to be common, but try to avoid them-they cause as many hassles as they solve in most cases.
I hope that the LCD backlight is ok-they get dim, and they are no longer available.
In fact, if it is ok, consider converting the dimmer button to a on/off switch for the backlight-if you only use the backlight when needed, it will last a VERY long time!
The mod for this involves one pc trace or one resistor lead.
Bill Cheek can probably tell you more, as he has the tech manual.
BTW, if Tandy still has it in print, I suggest you order the service manual for the 2004.
Even if you don't need it now, you may well need it later.

: I think I will offer $50 less and see what happens.

Good move....125 would be a good price to pay for a 2004

At that price, go for it...the 2004 is a rather good box, although the 2006 does a bit better on am air band.

: Thanks for the replys.

5756. Harris County, TX trunk system has me baffled

Newsgroup: rec.radio.scanner
Date: 1998-05-27 00:00:00 UTC
From: scott@conchbbs.com
Message-ID: <8b3_9805271646@conchbbs.com>
Source record: 159385

mulligan@ACM.ORG,

While this is all good stuff, Harris County is a SMART-ZONE system. Please don't confuse people. My information comes from a conversation between Life-Flight 3, Control, and a Motorola tech back when the Tomball satellite system was added.

Wednesday May 27 1998 12:46, mulligan@ACM.ORG wrote to All:

>Very sad.....

Yes but it is a still a great receiver. It is funny, as a Canadian I have unblocked scanners plus blocked ones and I dont find cell to be really that interesting. For starters, it is extremely temporary in nature as callers switch to different cell frequencies as they travel. Secondly it is depressing as it seems that the worst of human nature is always present in the cell bands. I understand from a public right point of view that the airwaves should be publicly available and the law in the US doesnt accomplish much. I quickly bored of the cell frequencies and focused on the usual police, fire, ambulance and other services. They are far more interesting and certainly less personal. The pro-2045 does a great job on those and I find I barely use my PCR-1000 for scanning the cell frequencies these days.

There's a good idea. What the heck?

As for the Volume Control, squirt a teeny weeny
snort of WD-40 into the opening and rotate the
control a few times. That will take care of that.

> 2006 does a bit better on am air band.

Only because the 2006 has a 6 kHz ceramic IF filter
expressly for the AM mode which the 2004 does not.
Actually, that extra IF filter was added in the
PRO-2005.....

It is easy to add to the 2004, though. Salvage
a 455 kHz IF filter from a junked CB radio and
you're in business. Comparing the 2006 schematic
to one for the 2004 makes it clear where the new
filter has to go.

5767. F/S Welz 2000/AX 400E Includes everything

Newsgroup: rec.radio.scanner
Date: 1998-05-27 00:00:00 UTC
From: orm@ix.netcom.com
Message-ID: <356ca46b.4664900@nntp.ix.netcom.com>
Source record: 159396

F/S Welz 2000/AX 400E Includes everything

I have a AX400E that I am thinking of parting. This is the European version in excellent condition, (like new) and I also purchased a welz case for it. I modified the case so that it will have a belt clip attached, and also purchased 6 AA rechargeable Eveready batteries and charger. I also have 3 types of antennas that come with it, a normal rubber ducky, a European style, very small stealthy 800 mhz style, and the radio shack extended (the one with the black thing in the middle). This unit covers 100K-1300mhz uncut. All accessories are included in this package, all I ask is that we do this Via COD. I will have it boxed up and out the door as soon as I get deal. Box and manuals included. Also I am adding a pair of Sony tear drop headphones to use with the unit. $400.00 takes all, this includes the COD and shipping Fee.

This is the little cute scanner that does tons of features. You can fit this in your pocket, almost the size of a cassette tape.

Here is some stats off my manual:

800 memory channels
20 search band channels
90 search pass channels

Frequency step: 1Khz, 5, 6.25, 9, 10, 12.5, 15, 20, 25, 30, 50, 100, auto

Two AA (will last a couple of days on alkaline and one day on nicad)

Weight: 200g (includes antenna and batteries)

Freq: 0.100 Mhz - 1299.999 Mhz

On/Off Illumination (green)

Here are some links to check it out : (these links may show the welz 1000 or ax-400, the one I have is the enhanced version, with more features)

http://www.interlog.com/~ahr/ws1000.html

http://www.bander.com/export/welz.htm

http://www.javiation.co.uk/

http://osha.igs.net/~durhamradio/welz.htm

http://www.dlcwest.com/~dx.comm/products/ws2000.htm

http://www.qsl.net/n2mca/WS2000.HTM

Please note that the above links have nothing to do with this transaction. I am using these links only as references. The prices above may be less then my price but does not come with the extra accessories, plus you must pay extra fee's via customs. I will sell this unit only within the US.

Thanks,

orm@ix.netcom.com

Hi folks:

I've been experimenting with a BC235XLT, a great little scanner, but I've found that there are very few trunked radio systems in central Pennsylvania and only one in my immediate area (in State College).

Meanwhile I keep hearing about plans to have all state agencies on a trunked system, state police, forestry, game commission, DOT, everybody...but I haven't been able to learn anything definitive about the status of that proposal.

Anybody out there have any solid info on that development, or comments in general about the use of trunked systems (and receivers) in Pennsylvania?

Once and for all: owning a cell-capable receiver is legal. Modifying one may be illegal. Offering info on modification is legal. Listening to cell frequencies is illegal. However, the risk of prosecution for the casual eavesdropper is nil, none, nada. If you record cell conversations and then publicize them, then you hit the jackpot. End of story.

5783. BC 200XLT Battery Voltage Level Problem

Newsgroup: rec.radio.scanner
Date: 1998-05-27 00:00:00 UTC
From: Rick Lutzinger <rjlutz@home.com>
Message-ID: <356B72E5.BF6C2DF4@home.com>
Source record: 159503

My 200XLT will not turn on unless the supply voltage is greater than that available from the fully charged battery pack. I just replaced the battery pack, removed the zener diode and resistor per the standard modification to eliminate the "low battery" circuit. The scanner will power up and operate perfectly so long as the charger is plugged in and the voltage at the battery pack terminals is higher than that available from the battery pack alone. The battery pack terminal voltage is normal. Anyone seen this problem before? It still didn't work with the new battery pack before I removed the zener and resistor.

Does anyone have a schematic or service manual for this unit?

My recent research suggests to stay with the same type of battery only
look for a higher mAh output IF your scanner has a charging circuit
built into the battery pack like my BP-205 does.

You may need to turn up the squelch a little. Your scanner is thinking it is
picking up on a signal near another one because the signal is very strong or
nearby. If you turn up the squelch, you may be able to stop it from stopping.
Of course you lose all of the lower strength signals.

I can see how this would happen with a very strong signal,
especially if you are using a rooftop antenna.

It is a fact of life on my BC9000XLTs, Plectrons, and
a few other radios.

Hope you can compare your PRO-67 side by side with another PRO-67.

From a repair perspective, I'd first determine if
the behavior is symmetrical with respect to the center
frequency. For example, will your PRO-67 stop on a memory
channel 15 kHz above the signal, too?

If the behavior is symmetric (stops + and - 15 kHz from center)
AND the main signal is moderately weak:

this implies poor IF selectivity, e.g., wide filter or filter
blowby.

If not symmetric:

the PLL reference oscillator is probably off
frequency. This is a simple internal adjustment on many Uniden
portables, though I don't have a service manual for the PRO-67.
A repair tech would need the proper alignment tool and (optimally)
some calibrated test equipment.

Without a frequency counter or signal generator, a tech could;

1. listen for the PRO-67's 1st LO using an accurately calibrated
receiver with a product detector (e.g., ICOM R8500), or

2. tweak the LO while tuned to a "known accurate" transmitter
(e.g., NOAA weather radio) and monitor the discriminator

3. beat the PRO-67's LO against the LO of a "known accurate" scanner
while listening to the beat note using a third receiver.

Good luck.

Come on guys.... As with ANY Radidio Shak stuff (which is mostly low end Uniden) the receiver is W-I-D-E... Try programming in a freq that is 1 channel (5KHz) away from the one you want and lock out the one that's 'right'... 99.99999% of the time you'll hear the locked out channel just fine 5KHz away. That's true on everything that's a retail product these days. You'll need a $2500 radio to get rid of that problem.

Dave Pascoe KM3T <km3t@contesting.com> writes:
>..how does one store a frequency in the available memory banks?

1. While the scanner is searching in any selected band, hit the hold button, then use the arrow keys to go to the freq you want to program.
2. Select the bank you want to program the frequency into (i.e., Private, Police, DOT, News, or Fire.
3. Use the arrow keys again; this time to go to the channel you want to place the frequency in.
4. Press PROG, and the frequency you had selected is programmed into the channel of the bank you selected.

BTW, the BCT7 has been maligned by some, but I love mine, especially in the Search mode, where you can SearchSkip frequencies in the AIR band!!!

Do some troubleshooting around the 5 volt regulator that powers
the CPU. Measure the voltages on the input and output terminals
with just the battery pack, and with the pack plus charger.

The results might point you towards the fault.

Many GRE-built scanners have a ZeroMatic (tm) circuit which detects this condition and keeps the scanner searching until it is on the correct frequency. (I'm assuming you're referring to searches, not scanning programmed channels.)

IIRC, the Pro-67 is a Uniden product, so it may not have the required hardware to prevent these premature hits.

My BC2500XLT had this glaring flaw, but luckily, I managed a straight trade for a far superior Pro-43.

The one time I tried doing a search and store with the 2500 in the 800 MHz band, I got _many_ hits that were 12.5 kHz away from all the local emergency services. Not too impressive.

>Is that to be expected in modern scanners? Is there a simple
>adjustment to fix it? Is it a particular problem with the 67 or do
>I have an out-of-spec unit? Aside from locking out channels just
>below the frequently used channels, can I do anyhing about it?

It may be normal for the '67 and therefore "unfixable" (and not covered by the warranty since RS won't consider it to be broken), but I can't say for sure since I don't have any experience with the '67. Your best bet would be to get some reports from other '67 owners.

Message-ID: <1998052804521700.AAA20284@ladder03.news.aol.com>
Source record: 159244

Hi all...

Does anyone out there have a schematic for the Regency HX1500 scanner? I accidentally plugged it into a power supply of reversed polarity, and now when I turn it on, it tries to start scanning, but then within a 1/2 second or so, the display say FR ERR... Some fuctions still work, such as programming search scan limits. It is also retaining the programmed frequencies in memory. Any ideas on how to repair this, or where to get a schematic for this radio? Or should I just give up and get a new scanner... Or does anyone have a used HX1500 for sale, either working or not....

Thanks for any help that anyone might be able to provide....!

Ted

About 5 years ago I bought a Pro 2006 and never learned how to use it. (I know nothing about radios or scanning and ran out of time to learn.)

My interest has rekindled but I hear about trunking and wonder if the 2006 is worth working with or should I look into a new one?

Thanks.

For Sale:

A PRO-2006 scanner fully functional - no blocking of frequencies.
$350 (this is the best scanner known to man). Also, two modification
books for this scanner (no hardware modifications were made). Excellent

condition, but I really don't do scanning anymore like I used to.

A dual band 2M 70cm handheld Yaesu FT-470 with three battery packs,
quickcharge desk scanner, case, etc. $325.

A connectix B&W camera, perfect condition - plus microphone $75.

All items above assume, buyer pays COD shipping charges.

Email to jccj@enteract.com if interested.

That is true , While living in Connecticut I had asked one of the Troop commanders why they did not have any restrictions on scanners in automobiles, he stated if a crime is commited and they put out an APB on the suspects there is a chance that someone with a scanner may see them and report their location.
I know N.Y. and Mass. have restrictions on mobile units and portable units, their thinking is the criminal element will use them during the commission of a crime and since they have a law that states it is illegal to have mobile and portable scanners the criminal element will obey the law and not use them.
Government stupidity at it's best.
The young boy asked the shopkeeper why do you padlock your shop door when you close, he answers, to keep honest people out .

Source record: 159282

I downloaded the program this AM and had it running in 10 minutes. It is extremely slick and about time.The program is free but, a registration fee is requested if you like and use the program frequently. I have 3 CE232 and 2006's and have been chomping at the bit for Windows software. The CE232 in its stock form is a great system and this Windows software puts it up and over whats out there. It seems to have been made by a Radio Hobbyist not a "I need to make bucks" outfit. So it does what we want not what someone else THINKS we want. I have no attachment to the CE232-Pro2006 or this program. Just thought I wouold help spread the word. Thanks Paul, Ira Cooper

Im trying to receive a stronger signal on my scanner than Im currently
getting with the stock antenna,not to mention it is a pain constantly
raising and lowering the tight telescoping antenna...Is anything
available,or can anything be suggested for indoor use,Im on the first
floor of a condo,
cant install a roof antenna,have no attic,but really would like to take
better advantage of my new scanner!!I have a small patio with a 4
ft.fence,but nothing can be seen over the top,condo rules..
I know somebody out there is either in the same predicament or has been
at one time..I sincerely appreciate any help!!!
Happy Scanning!! Barry

my basic thought--product sold recvs- year 1990--now 1998-
fcc says no more products sold-a unit was pulled from the market
that can perform the function-just before the law changed. PRIVACY
law not writtren.-they dont won't
you to recv..personanly thought of it as--freedom of the press--the
control is on the seller of product--yes there is a place that sold
a modification book--covered most--not sure of new--have the
address but have to find. I work on scanners--now if you was
listening in on the pres-c..and monica--starr will get you.

I had discovered a similar symptom comparing my old 100xlt and my new
235xlt, but had opposite results when I switched the antennas. In my case,
the 235 worked fine with the old antenna and the 100xlt went deaf with the
new one. I got a different antenna for the 235 and all was well. I
understand there were numerous antenna problems with the 235 series.

However, your symptoms do sound receiver-, not antenna-, specific. Sorry I
can't be of any more help...

I dunno. This is pretty slick marketing. They've photographed a black radio with a highly technical looking display at the most pleasing angle and menacing light. Seems to pulsate "Buy me,.....I'm one of those bad boy radios that you've been hearing about". The heavy duty price is almost part of the sales pitch; "you're not just buying a radio, you're buying A COMPLETE COMMUNICATIONS CENTER IN A HANDHELD UNIT!!!! PERFECT AS A SECRET AGENT THINGY!!!

Bet it snags quite a few sales just by virture of its attractive display and apparent ease of sale (big button marked "ORDER NOW".)

And then consider the market; their advertising made it over to this NG allegedly as a goof: "Look at this......(sarcastic).....seems a bit high." Seems innocent enough.

But you know; the orginal message carried a subject line of "Good Deal?" Everyone's reply, including mine, read subject: "Re: Good Deal?"

THE MARKET: A Dejanews search for "scanners" pulls up this group. Newbie wants scanner because he see scanner at friend's house. Friend's scanner seems to listen to all kinds of things. Newbie thinks that's cool. Friend has old radios and won't "cell" any of them to Newbie. Newbie sad.

So Newbie search Denanews and ends up here. Newbie clicks on "Good Deal?", follows link to attractive looking hand-held. Goes "Ooooooooooouuu" and clicks the pretty button.

They're gonna sell a few of these scanners.

I was very disappointed in the AR2700 I tested for Monitoring Times.

If you want a PC-controllable portable scanner and don't
require 0.5 - 25 MHz shortwave coverage, consider the new
Sony ICF-SC1PC instead.

My Sony sample unit works much better than the AR2700 I reviewed.

From the FAQ article SCANNER RADIO REVIEW BRIEFS:

[...]

AR2700: 1995 vintage. 500 channel portable covering 500 kHz
to 1300 MHz. Lots of good features, e.g., 10 linkable
search banks, lighted keypad, per-channel attenuator, S-
meter, battery meter, optional voice recorder and speech
inversion descrambler. Global rescan and pause delays, but
no auto store, data skip, nor battery saver. Internally
generated noise results in broad birdies on AR2700 tested.
Insensitive carrier operated (vs. noise operated) squelch
stays closed on signals unless they are moderately strong,
causing scanner to skip transmissions of interest. IFs are
287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700
Portable Scanner," by Bob Parnass, AJ9S, in Monitoring
Times, October and November 1995.

Hi ho, all,
While I'm well aware of the wonderful Etrunk.exe program that will allow trunk tracking of the Ericsson EDACS trunk radio system, is there any other program out there that will use a SINGLE scanner to trunk-track. I know the limitations in doing things this way, but it is a little difficult to tote two scanners about just to listen to the EDACS system. One scanner and a laptop is tolerable.....
And does anyone know of the AEGIS system which is integral to EDACS? I have some basic info, but I'm looking for more....

Message-ID: <6kna9j$s7i$6@clarknet.clark.net>
Source record: 159117

Hello. I've seen that Radio Shack sells 2 (one handheld and one mobile/ship model) Marine radios. Well, I noticed that they didn't mention anything about having to have a license to operate them (as they usually do). So I checked the FCC web site and they said that as long as you own a private ship, you don't use it for business purposes, and you obey all of their preset rules for the frequencies then you can use them.

Here's my question. You see, I have a base station on land that I use for all of my other radio communications. I was wondering if it would be a violation of FCC rules/regulations to use a marine radio at my base station (which is located about 20 miles from the nearest body of water) to communicate with boats using the band, for personal purposes. Could I do this? Or does the FCC specifically prohibit it? Thanks a lot for reading, any help is appreciated!

>U.S. MARS/CAP license.

With CAP you must pass a written examination at which time you will be issued a Radio Operators Permit (ROP) card. To be issued a license and receive a callsign you must apply for one with the wing communications officer. Tune your scanner or 2m rig to 148.150 FM-123.100 AM and listen to Search and Rescue activity, Air Shows and Disaster Relief efforts.

Anti-terrorism exercise set at Pentagon
By Charles Aldinger

WASHINGTON (Reuters) - Police and rescue vehicles will be rushed to the Pentagon Saturday in a Defense Department exercise to test emergency response to a terrorist attack at the U.S. military's sprawling headquarters.

The simulated crisis will include the taking of hostages in the office of Defense Secretary William Cohen and the accidental release of a simulated chemical agent causing mass contamination of troops and civilian workers.

Cohen and other senior U.S. officials have been warning of the growing international threat of chemical and biological agents in the hands of rogue states or terrorist groups, and Saturday's exercise will include some 700 civilian and military police, emergency and medical personnel and the FBI.

Recent studies have said that civilian and military organizations in the United States are woefully unprepared to deal with a "chem-bio" emergency, and steps have begun this year to organize response teams in major American cities.

The scenario of exercise "Cloudy Office" Saturday will involve an unidentified radical group entering Cohen's office in the giant Pentagon building on the banks of the Potomac River near Washington.

The Defense Department said that during a period of negotiations with the mock terrorists, there will be an accidental release of a simulated chemical agent that will "require a response to a mass casualty incident involving contamination of personnel."

More than 20,000 military and civilian government personnel work daily at the Pentagon, but that number is reduced sharply on weekends.

"The purpose of 'Cloudy Office' is to exercise force protection responsibilities and to test the response by civilian emergency components to a hostage and barricade situation complicated by the threat to use weapons of mass destruction," the Pentagon said in a statement.

The unidentified "radical group" will take over Cohen's office with the objective of forcing U.S. intervention to prevent a country from using weapons of mass destruction against its own people.

The crisis deepens when a simulated chemical agent is released accidentally during negotiations with the group.

> WHY would you say crap like this to ME, yet NOT say ANYTHING
> even close to Bill Cheek?

Because *YOU'RE* the designated RRR idiot. You're an obsessive compulsive with a penchant for bogus posts, rouge cancels and general lunacy.

It's been real nice without your warped logic running circles around common sense for the past few weeks. What happened? You get your medication changed?

Why don't you slip on another one of your bogus identities and (compania, RADIOFAN, rick from AOL) and post something akin to praise about John Mackey. Your virtual support group might come in handy, cause I intend needle you for every stupid thing you write. I'll be here to record your activities and point out your screw ups.

You don't need a therapist, you need a friggin' team working around the clock on your sorry ass. None of this "once of week" stuff. You need half a dozen doctors probing and testing you in a secure lab somewhere in Vienna. That's what you need: Team approach psychiatry.

You friggin' loon.

>Bob
>
> Bob:
I own a 2045. Picked it up at RS on a clearance sale and ordered the
optional CTCSS board. I'm not sure I understand your question.

The 2045 is a 200 channel triple conversion receiver that includes the
military air band and has lots of neat features besides CTCSS capabilty. It
has a data skip function that works well. It has an attenuator that can be
programmed for individual memory channels. There is a weather alert function
(for those who want to be blasted out of bed to warn of an impending
overnight
storm ;-) and a counter that keeps track of "hits" on active channels.

At it's original price of $349, it might have been a bit pricey but for
$149 (price is now lower-if you can still find one) I think it was a
bargain IMHO.
John

Ted,
I had an HX-1500 that did the exact same thing. I was never sure what created the problem because I took good care of the scanner. I also had some friends with 1500's who had the same problem. Perhaps it is a manufacturing flaw with the scanner. Back when the scanner was new (1987ish) I sent it back to Regency two times. The repair shop returned the scanner with a note reading: "unit performs to specifications." You may be better off buying a new one (although the 1500 is a great scanner with fantastic range). I recently replaced mine with the Relm HS-200. I have been really satisfied with it. Hope this helps.

Maybe because Bill Cheek contributes some worthwhile articles to this NG but all you have posted is crap complaining about Bill Cheek. You have never yet shown that you at least know Ohm's Law, let along anything about scanners.

Get the chip off your shoulder about being kicked out of Fido and come up with something worthwhile once in awhile, asshole.

>
> Thanks for any help that anyone might be able to provide....!

Hmmmm....It *may* not be that bad.

How long was the supply connected?

Have you tried another set of batteries?

What was the current rating of the "power supply"?

Did you even have batteries in it? Were they rechargeables?

Is the Low Bat indicator on?

In these scanners, the power connector is connected *directly*
across the battery. If your adapter had enough current to
overcome the battery (ie: quite a few amps - like a direct
connection to a cigarette lighter), it could have done some
damage.

If the adapter was the typical 500mA type, it may have just
discharged the batteries.

The only way the power could "reverse" to the scanner circuitry
is if the battery was "overcome" by the wrong polarity.

Also, if one or more of the cells *were* damaged, they battery
load down the adapter to the point that the total supply voltage
is too low, causing the usual low-battery symptoms
(Chuf-Chuf-Ping!-"fr err" - HX1000/1200/1500 owners know that
sound!).

I have accidentally reversed the polarity to my 1500 a couple of times, and it survived (not much current, tho).

Fix it if you can. Aside from the somewhat poor image rejection and "small" number of channels by todays standards, they are still excellent units.

Try swapping the batteries, or remove one of the batteries and run it off the (correct) adapter.

BTW: It is wise to scratch a little notation next to any unmarked power jack noting the polarity. I usually just write "Tip-" or "Tip+".

Good Luck!

Cheers,
Paul Grohe

What is a PRO-2942?

5896. Near-field Cellular interference

Newsgroup: rec.radio.scanner
Date: 1998-05-29 00:00:00 UTC
From: Sean Murphy <zosoiv@jps.net>
Message-ID: <356E8070.218A64E0@jps.net>
Source record: 159168
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Has anyone experienced the notorious "near-field" cellular (nearby phones and cell sites) data channel interference while using the BC-235XLT or the PRO-90?

Well, I have. It's not pretty. The cellular data channel interference from nearby cell sites as I pass each one by in a vehicle can actually wipe out the data channel of my local community's trunked system and throw the radio back into the trunk "search" mode from a scan mode, apparently disrupting the trunked system's data channel... I have also had the same phenomena occurr with cell phones in use within 10 ft of the radio typically.

Can someone say INTERMOD? hmmm... Mind you, this radio is new, with a custom, 800 Mhz. band resonant antenna, and in all other respects is operating fine.

Spammers & flamers need not reply. Those with contributions of a constructive nature, please share your like-experiences via e-mail and this thread within the groups posted.

Regards,
Sean

Not any more! Opto has just released two products that work on
EDACS and were announced at Dayton. There are two articles in
the latest MT on one of them; the DC442 OptoTrakker decoder
box. The other product, the OptoCom, is made in collaboration
with GRE and is basically a 2042 receive board with an OS535
built in and runs with Scan*Star software. They also work on
Mot systems and allow trunked and conventional to be monitored
at the same time.

For more details stop by :

Source record: 159171
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I noticed a similar problem when I compared the sensitivity of the BC235XLT with an old BC70XLT. The 70 would pick up transmissions on frequencies that were "loud and clear", and the 235 would pick up mostly noise when set to manual for the same frequencies. I swapped antennas and the results were the same, so it isn't the antenna. I tried reorienting both radios for a directional "best aim" and got the same results no matter how I pointed or turned the radios.

The BC235XLT is just NOT a sensitive receiver.

I have a number of other complaints about the BC235XLT and will no longer recommend it to anyone unless I tell them about those complaints first. I will eventually document those and post them.

character in the right margin.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip

using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna

Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency

lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the

scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 fee for 200 hours use of the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83
and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, | published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $49 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal

chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his BC210XW.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a

flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the

microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd

electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1997 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K
_____	_____

HAMFEST/COMPUTERFEST CALENDAR 1998 - NORTHERN ILLINOIS
last updated May 20, 1998 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, and ARRL for providing some of the information.

JUNE 1998

Jun 7 (Sun), Princeton, IL - Starved Rock RC. info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341. tel. 815-795-2201 (Usually an excellent hamfest. Unlimited space outdoor flea market, some indoor space, though few big name commercial vendors. Crude restroom facilities. - AJ9S)

Jun 14 (Sun), Wheaton, IL - Six Meter Club of Chicago. info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Ave., Downers Grove, IL 60516-3925. tel. 630-963-4922

JULY 1998

Jul 12 (Sun), Peotone, IL. Kankakee Area Radio Society. Will County fairgrounds. info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. tel. 815-939-7548, E-mail: k9nr@juno.com.

Jul 19 (Sun), Sugar Grove, IL. Fox River Radio League. Waubonsee Community College. For tables, tickets, and information: contact N9UZC James E. Von Olnhausen, n9uzc@amsat.org, (630)-879-3042, FRRL, Box 673, Batavia, IL 60510-0673. (good, small to midsized hamfest. Modern rest-room facilities. - AJ9S)

AUGUST 1998

Aug 2 (Sun), Peotone, IL. Hamfesters Radio Club. Will County fairgrounds. info: Dave Brasel, NF9N, 6933 West 110th St., Worth, IL 60482. tel. 708-448-0580 (Usually an excellent hamfest - AJ9S).

Aug 8 (Sat), Quincy, IL Western Illinois Amateur Radio Club |
Quincy, Illinois. Ham Radio and Computer SWAPFEST 1998 |
8:00AM to 2:00PM. The Western Illinois 1998 Swapfest |
will be held at the Eagles Alps Grounds (3737 North 5th |

Street) 4.5 miles north of downtown Quincy, with easy access |
from US Highway 24. Admission is $3.00 at the Gate ($2.50 |
in advance) per person, under 12 - Free. ARRL VEC testing |
for all license classes at 12:30PM. Indoor Flea Market |
space available for $5.00 which includes one 5' table. |
Outdoor tailgating space - Free. Talk-in on 147.63/147.03 |
MHz. Plenty of convenient parking available. Lunch will be |
served on the grounds. Children's playground area. Card |
Checking for ARRL awards at 9AM, 10AM, and 11AM. For addi- |
tional information contact N9JF, jfunk@adams.net. |

Aug 23 (Sun), Woodstock, IL. Tri-County Radio Group.
McHenry County fairgrounds. info: Bob Grosse, N9KXG, PO Box
3107, Skokie, IL 60077-6107 tel. 708-944-0500. E-mail:

AJ9S)

OCTOBER 1998

NOVEMBER 1998

NOTES - Computer Central and Giant Computer shows

Computer Central computer shows are held at the College of
DuPage, Main Arena of the Physical Education Building Park
Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5
admission with card, normal admission $6.00. Opens 9:30 am
- 3:00 pm.

Giant Computer shows are usually held at the Orland Park
Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or
at the DuPage County Fairgrounds, County Farm & Manchester
Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM
- 3 PM. To get on the mailing list or get more information,
call (847)974-3123. See http://www.gicancomputershow.com

archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com/support_electronics/2849.html. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic

front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive
LeRoy, NY 14482.
tel. 716-768-8151

Jan Crystals
Box #-6017
Fort Myers, FL 33911
tel. 813-936-2397

Monitor Crystal Svc
124 W Walnut St Watseka, IL 60970
tel. 815-432-5296

Short product summaries for over 70 scanner models appear in
a separate article, entitled "Scanner Radio Review Briefs."

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested.

Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks,

not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be

arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service

Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older

Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as

federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during

search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby

SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other

owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be

loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound

Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod,

especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT

but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150

148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both | Plectron and Motorola Alert Monitor receivers in June 1998 | Monitoring Times magazine. |

You can buy the proper replacement power cords but it's | much cheaper to drill a hole on the rear panel and solder |

on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Minimum Volume Setting

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760

email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

The information at the Optoelectronics site only state the products are capable of tracking Motorola and LTR. Can it do EDACS? That and the hardware seems a little expensive for a little black box. Most of that stuff can be done with home made hardware interfaces and a computer for next to nothing in cost. On top of that, monitoring a trunked control channel, using a computer, will also give you individual radio ids along with group ids, which I find really neat. About the only thing I like about the Opto idea is the ability to monitor multiple trunked and convential frequencies at the same time . . . but isn't that why I've got a couple scanners already? Maybe if your just getting into the hobby and don't have a clue about electronics or software this would be a good, semi cost efficent soluntion. That's just my

opinion, and sombody confirm the Opto's ability to track EDACS . . . .

Jeff

Or even better yet.........

You can usually get out of date Airport/Facility Directories from
flight schools for free. They are updated every 56 days or expire
every 56 days depends on how you look at it.

PS You will have a better chance at the flight schools as most of us
pilots give our out of date charts to flight schools for training
purposes. They are usually free for the taking.

5938. Trade Pro26 for ATS 909

I had Gerrry give a tune up to two sentimental value BCIII's I own. He also installed the crystals that i needed for each. His work was great (I listen to both each night) the prices were right and I have to say that i would personally reccomend him and his work to anyone based on my experiences. If I were to have one complaint, it would be a simple one. I am very jealous of his basement. I wish his basement was my basement. Other than that, anything that I own that is Electra or Bearcat will be going his way when it needs anything.
Happy Scanning,
Ray Miller N2NJK

If they ever use a two way radio, then they might use these frequencies. However, being an investigative unit and the fact that they cover such a huge area, I am sure they probably rely on cellular phones for mobile communications. They might use 155.505 when operating surveillance or narcotics operations.

I like the Pro-91. I too like the battery arrangement. I don't think the fact that the Pro-91 only has 150 channels is too much of a disadvantage. I do think the Pro-90 has a better receiver. When I listened to them side by side the Pro-91 seemed to have a higher background noise level.

MervinS wrote in message:

Hi:

I'm looking for recommendations for headphones that folks use
with their scanners at the race track. I was at the Miller Lite
200 in Milwaukee today and noticed a guy using
"RaceTRAC" brand headphones with his SC150B.
Are there any other brands on the market?
Where do we buy such things?

Thanks.

-Scott

P.S. One other wierd thing I noticed was that the
vendors at the race were selling SC150s cheaper
than I can buy them in area stores. Very odd....
I don't know how many people drop that kind of
money on a whim at the track but it *was* a very
good price.

5969. 900 megahertz phone freq

Newsgroup: rec.radio.scanner

BS>Every night while scanning from 900-1000
BS>MHz.on my pro 2045,I get the same pair of lovers talking to one
BS>another at exactly 906.000 and the signal is so strong they sound like
BS>they are both in the room with me!!This is not cellular,as the
BS>freq.locks in solid!!Could this be one of the 900 megahertz cordless
BS>phones,I'm guessing it has to be!!Also,with a signal this strong,how far
BS>away might this call be coming from in distance compared with normal no
BS>900 MHz.cordless phones?

It sure sounds like cordless phones from what you're describing.

Gidday From downunder in New Zealand.

I have a BC3000XLT scanner for listening into my local aviation activity
but struggle to receive my local Tower frequencies from my house. I
invested in a Diamond discone antennae and
it improved reception marginally.

I live on a farm situated in a valley. At the back of my farm it is
2500ft higher than at my house so I decided to take the aerial up there
with excellent results, I couldn't keep the scanner quiet.
My question is, is there any way of getting this reception at my house?

I would appreciate any advise you might have.

Regards

Hayden McIntyre

Oh, sure. Dozens, Liken unto LOTS, anyway.
I recently posted several FAQs in this newsgroup
that will guide you into a starting point:

SCANNER MODIFICATIONS FAQ
SCANNER S-METER FAQ
SCANNER DATA FAQ
SCANNER PERFORMANCE FAQ
SCANNER RADIOS FAQ

You can also cruise to my FTP site at:

ftp://204.210.11.204/faqs/index.txt for:

INDEX .TXT This index of Frequently Asked Questions files
ADMIN .FAQ for administrative and business matters
SCANDATA.FAQ on decoding digital data from the airwaves
SCANMODS.FAQ on scanner modifications
SCANPERF.FAQ on scanner antennas and performance issues
SCANRADS.FAQ on scanners and radios used for scanning
SCANSMTR.FAQ on S-Meters for scanners

There's enough there that barely scratches the surface
but it will keep you preoccupied for a while.

Source record: 159078

For sale:

A Yupi 9000. Only 4 mos. old with the box. Purchased from Bandercom with the speed and bleed mods done. This unit also has a discriminator output for grabbing POCSAG and such.
Bandercom did all the mods and did a great job.

I had to pay some extra for the mod and with shipping and such I have about $600.00 in it. ($559.00 for the unit, $40.00 for the discriminator mod + shipping)

I will let the unit go for the $600.00 I have in it. The unit still has most of the original warranty left. Of course, shipped domestic there are no customs concerns.

I am getting married and have to get rid of some of the toys.

Mail me if you have any questions or if you have an interest.

Unfortuantely, the mil air band(225-400) isn't received by
many scanners these days. And of those that do get it, they're
usually high end(read 'expensive') models.

> I'm new to radio, so I would appreciate any suggestions on
> what to buy.

Try these pages :

http://www.qsl.net/n2mca/STARTING.HTM
http://www.qsl.net/n2mca/PICKRECV.HTM

> I don't want to spend too much, as this will be my first scanner.

How much is "too much"? If you want to limit the expense but
still get mil air, you might wish to consider a used radio.

You might find a discontinued PRO-26(handheld) or PRO-2042(base)
at your local or nearby Radio Shacks. PRO-26s were going for
$200, I believe, and the 2042s $300.

New models that cover mil air will run you $300+. The new
Sony ICF-SC1 covers mil air and most carry it for around $260
so you might want to check that possibliity.

Good luck!

The Amateur Radio Frequently Asked Questions (FAQ) List, formerly maintained by Diana Carlson, KC1SP and Ian Kluft, KO6YQ, has recently been resurrected by John Seney, WD1V. The majority of the original content of the FAQ remains the same, but now it's a hypertext document with hundreds of links to radio-related sites and is a significant resource to all students of amateur radio - regardless of their license status. It may be accessed as a WWW Page:

http://www.mv.com/ipusers/wd1v/hamradio.faq.html

It is also available in text form. Send an message to John's E-mail address below with the words "HAM FAQ" on the subject line.

Please direct any submissions, feedback, or administrivia regarding the FAQ to wd1v@amsat.org

73,

John D. Seney, WD1V

Brenham, Texas has a nice lake nearby called Somerville that I go to on the weekends.

Does anyone have any of the freqs for this area, Sheriff, Constable, State Trooper, or local PD?

Thanks!

Charles

This is either from a Police or CHP channel. The officer will say something or other. Then the station will notify him of an encoded transmission I guess. Then you here static, but it's some encoded message. It's like you detuned your channel, but it stops, and goes. What is it, and is there any software for it?

Tony Heatwole <heatwole@shell.clark.net> wrote:
> I was wondering if it would be a violation of FCC rules/regulations to
> use a marine radio at my base station (which is located about 20 miles
> from the nearest body of water) to communicate with boats using the band,
> for personal purposes.

The FCC classifies that as a Marine Coast Station. The application is
made on FCC Form 503 and the fee is $105. Assuming you're not repairing
container ships in your back yard (or operating one of the other specified
facilities), about the only chance you'd have for getting an application
approved is if you could convince them that you're "A nonprofit organization
providing noncommercial communications to vessels other than commercial
transport vessels".
The Maritime Service is for ship/ship and ship/shore facilities traffic.
You'll have to stick to ham or cb for non-operational communications. There's
probably a certain amount of abuse of the marine VHF band, but you might
find your ham ticket at risk if someone complains.

6003. Questions about Bearcat 150

Newsgroup: rec.radio.scanner
Date: 1998-05-30 00:00:00 UTC
From: Scott Herring <redcross1@geocities.com>
Message-ID: <6kpnvr$s2e$1@news1.epix.net>
Source record: 159090

Bought this scanner at a yard sale. I know, asking for trouble. But the question is: Is there any way to fix the fact that the number 7 keypad doesn't work right, and how many channels does it actually have. I'm thinking 10, but I'm getting a double display when I press the manual key. it goes from 11 to 22 to 33 and so on to 00.

Any guidance would be appreciated.

<lcval1@mail.netcon.net.au> wrote:

>Comments on this RX appreciated. With the features it
>seems to be a better buy than an Icom IC-R7100 -
>
>Damien VK3RX

Are the R7100s still available in Australia?
ICOM is marketing the newer R8500 in the USA.
I owned an an ICOM R7000, R7100, and now an R8500.

An AOR 5000+3 is now available, but I've not tried it.

I've tested both the original AOR AR5000 and ICOM R8500 and published
full length reviews and comparisons in Monitoring Times magazine.
They are both great radios, but I chose to purchase R8500 after
testing both.

Here are the passages I wrote in the FAQ "Buying a Used Scanner:"

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage
super receiver. Good sensitivity throughout. AM, SSB, CW,
FM detectors. Frequency readout to 1 Hz. More features
than any other radio. DTMF reader and RS-232 interface
included. Multiple settings for IF and AF selectivity,
attenuator, AGC, deemphasis, etc. DB9 RS232C connector.
Negatives include low contrast LCD display and difficult
user interface. NFM squelch closes slowly, causing noise
burst at end of each NFM transmission. Electromechanical
relays click at various frequency boundaries, including 400
MHz, producing a clickety-clack noise -- annoying while
scanning banks of mixed band frequencies. Great radio,
otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob
Parnass, in Monitoring Times, December 1996.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks
of 40 channels although bank sizes can be changed. 100 Auto
store and 100 Skip memories but that can be increased by
reallocating channels from the conventional scan banks.
Fixed and programmable step sizes. Relays clickey-clack
while scanning across band boundaries. Triple conversion,
First IF is 48.8, 778.7, or 266.7 MHz, depending on band.
Second and third IFs are 10.7 and 0.455 MHz. Weak to
moderate cellular images starting near 1106 MHz. Rugged

construction. External power supply. DB25 RS232C
connector. Audio peak filter. Ok scanning and great
searching performance. See "ICOM R8500 Receiver," by Bob
Parnass, in Monitoring Times, January 1997.

Reprints of articles from Monitoring Times are available
for $3.00 US each plus a self-addressed stamped envelope from:

Grove Enterprises, P.O. Box 98, Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

Note: I don't get any part of the $3.00.

I've enjoyed owning and used a NRD535D for a few years
and much prefer the NRD535D over the AR-5000 for shortwave utility
listening. Its variable bandwidth and IF notch filter
are two important features lacking in both the AR-5000 and R-8500.

That said, I found the R8500 better suited for SWL than
the AR5000 due to its IF shift and AF peak capabilities.

The AR5000 I tested had more uniform sensitivity in the
1000 - 2000 MHz range than the R8500.
The AR5000 has more features than the R8500 for UHF/VHF
monitoring.

The AR5000's LCD contrast is poor, making it more difficult to read.
I found maddening its complex multi-keystroke sequences, required
to perform simple operations. Its 100 channel memory banks
are too large for organizing frequencies.

The R8500 is built massively on a cast metal chassis.
The AR5000 is smaller and much lighter in weight.
I found what looked like a few extra components "tack soldered"
on the bottom of at least one printed circuit board in
the AR5000 I tested.

Overall, the AR5000 is more flexible (except in memory bank
organization), but the R8500 is better built and much easier to use.

Good luck.

Everything on this program works great except the alpha pages are nothing but
messed up letters such as <BEL>)a<CR>,6<LF> AND x`X#0f
AND T0CL Thoes are 3 seperate pages. Does anyone know how to fix
this..
Number of recieved messages 4542
incorrect messages 1286
success rate 72%
overruns 32

I have already messed with the input volume and if its too high to wont decode
and if its too low it wont decode so i know i have it in the right spot.

I did the dis tap so the sound is not trrough the output from the scanner ie
ext spk or headphone jack.. Connected straight into the line in to the
soundcard...
im stumped...

Also does anyone know of another program like this one that will decode pages
with out needed the comm connection just the straight soundcard connection..
thanks in advance

For Sale:

A PRO-2006 scanner fully functional - no blocking of frequencies.
$350 (this is the best scanner known to man). Also, two modification
books for this scanner (no hardware modifications were made). Excellent

condition, but I really don't do scanning anymore like I used to.

A dual band 2M 70cm handheld Yaesu FT-470 with three battery packs,
quickcharge desk scanner, case, etc. $325.

A connectix B&W camera, perfect condition - plus microphone $75.

All items above assume, buyer pays COD shipping charges.

Email to jccj@enteract.com if interested.

Rich I must correct you ,OPTO has nothing and said nothing at dayton on EDACS.
To double check this i faxed OPTO and here is a quote from them.

"Jeff, Yes you are right, the OPTOTRAKKER will NOT decode EDACS and NO claim
was made to that effect.
Would we like to be able to do that?
Sure. Is it going to happen anytime soon?NO.

Kevin C ox
OPTOELECTRONICS

Sorry I more than anyone wants edacs decoders to sell etc

For starters I'd say it's because anybody with a pocket protector full of Radio Shack hexoganal Wonder Wands can legally go in and tune up radios these days & the FCC doesn't send anybody out to check deviation or tolerance any more.
Some depts have been known to try and get "cute" and tune up 5 KC off intentionally to screw up scanner users. You might try going + or - 5 Kc to see if that's the game, but it's probably just sloppy maintainence or a badly calibrated signal generator (or both).

6042. Re: had any luck with the Ramsey 800 Mhz converter?

Newsgroup: rec.radio.scanner
Date: 1998-05-30 00:00:00 UTC
From: grohe@galaxy.nsc.com
Message-ID: <3570b536.2883365@139.187.81.1>
Source record: 159152

On 29 May 1998 20:18:41 GMT,
in the newsgroup rec.radio.scanner,
tyler@nospam.com (tyler)
from Your Organization thoughtfully posted:

> I built mine a week ago and I can't hear squat. Has anyone had any luck with
> their converter? Any problems?

IF it is working, you should hear a dead carrier at 40MHz, and
at multiples of 40MHz (try 40MHz,160MHz,440MHz,480MHz).

If you hear the 40MHz, the oscillator is working. If you hear
strong 160MHz/480MHz signals, the multiplier should be working.

I posted this a few months ago:

=== A few notes on the Ramsey SCN-1 800MHz converter =====

The circuit is very basic with "okay" sensitivity, but I wouldn't
recommend it for DX'ing the 800MHz band! However, it is fine for
local reception. A cellular phone antenna works great. Be warned:
The output contains a very large (about -3dBm) 400MHz LO signal
that may overload, or cause images in, or even "de-sens" some
receivers. (Note: the input and output are not isolated, so the
40-400MHz LO RF energy will make it's way out to the receiving
antenna)

Some Tips:

1. Buy some PCB mount BNC connectors. The kit comes with RCA
phono connectors!

2. The oscillator that comes with it may cause some problems. The
oscillator is a standard 40MHz TTL crystal oscillator module. The
square wave output is multiplied 10 times to obtain the 400MHz
L.O. The module I received was 1KHz off frequency, which shifted
the output signals over 10KHz, enough to cause scanning problems.
I replaced it with a *80MHz* module and some socket pins. Now the
error is less than 2KHz. The 80MHz module seemed to give better
results (a cleaner LO signal) and a more accurate LO signal.

3. The power supply to the multiplier & mixer circuit is not
regulated and perfomance/sensitivity varies with supply voltage.
You will want to adjust the supply voltage for best reception.
This will make the biggest difference in performance. Try
adjusting the supply voltage while receiving a signal. Mine seems

to work best on 8.35V.

4. I also placed some 0.1uF ceramic chip bypass caps at some strategic places. Mostly this cleaned up the LO signal. The specific spots were:

a. The supply side of L5 to top ground plane (you will have to scratch away the green solder mask).

b. At the +5V supply pin of the oscillator to bottom ground plane.

c. The supply side of R1 to top ground plane (cleaned up LO).

d. Solder all leads that pass through both ground planes on each side.

5. Clean up the multiplier signal. If you have access to a wide bandwidth scope, connect the "antenna" output to the scope input with a 50 ohm input. The signal level should be around 200mVp-p. *Gently* spread apart, or squeeze, L6,7,8 & 9 and adjust them for the cleanest looking 400MHz signal. They will interact, but just adjust them for the nicest looking 400MHz signal (there will be "lumps" every 5-10 cycles). The actual signal level is not too critical.

6. The board is rather big for the size of the circuit it contains (10.5cm x 12cm). It definitely should be built in a shielded case (it does generate a lot of RFI). I would recommend one of those cast aluminum cases for good RF shielding.

Wadda' ya expect for $50!

Cheers,
Paul Grohe

Hit or miss. I was able to pick up the ATIS from BUF from about 50 miles away, depending on the orientation of the scanner, and the weather conditions. On the other hand, I could not pick up the DKK AWOS, and that was a mere 5 miles away. Line of sight always works, though.

GS>I believe Mr. Cheek is in error. The restriction on cellular capable or
GS>easily modified to be capable scanners only addressed those units
GS>manufactured or imported for sale. Thus the scanners would not in
GS>themselves be illegal nor would importing or building one for one's
GS>personal use be illegal. This distinction might be lost on a Customs
GS>person but if you read the act I think you will find it is true. OTOH
GS>using you scanner in a manner contrary to the ECPA is illegal unless of
GS>course you are a democrat.

I like that last part... Not being a lawyer, I can't state this as fact but I believe that you (you yourself) are not allowed to bring in cell capable scanners into the country. I do not think that the latest incarnation of ECPA makes the distinction between the individual and a dealer/distributor/retailer.

RS>OK, How about clarifying "The Law"? Is it illegal to own a cell capab
RS>scanner, or is it illegal to *use* it?

As far as the law goes, it seems to say (I am not a lawyer) that it is legal to own a cell capable scanner but not legal to listen to cell calls.

RS>Is it illegal to own a cell mod
RS>pro-2006, or to use it?

Yes, legal to own but not to listen to the cell portion of the spectrum.

RS>Is it legal to modify a scanner to make it cell
RS>capable?

Yes, you yourself but not a distributor or retailer.

RS>Is it illegal to publish *how-to* ifo. on modifying scanners
RS>make them cell capable?

Yes, the constitution guarantees free speech.

Robert Snelgrove <steelgtr@ix.netcom.com> wrote:

>Can anyone tell me the difference betwen these 2?

Most of the responses have listed the differences between
the PRO-2035 and PRO-2042. Further, here is a passage
of my PRO-2042 review in Feb. 1996 Monitoring Times:

"...Back in January 1995, we wrote that our PRO-2035 did not perform
as well as our PRO-2006 when listening to weak signals
in the presence of a strong station transmitting in the same band.

Using the PRO-2035, a moderately strong signal from the 460.525 MHz
sheriff's repeater 10 miles distant obliterates weaker signals
on frequencies 50 kHz in either direction and
produces hiss on weak signals 100 kHz away.
The desense phenomenon is a problem in the 155 MHz band, too.
Our PRO-2042 behaves slightly better than the PRO-2035 in this regard
but is still disappointing.
Neither the PRO-2006 nor BC9000XLT are disturbed.

The PRO-2042 uses different 455 kHz filters than the PRO-2006, and
the PRO-2006 NFM selectivity specs are better:
9 and 15 kHz (at 6 and 50 dB points respectively) versus 10 and 20 kHz
for the PRO-2042.
Experimenters might consider replacing the PRO-2042's
455 kHz NFM filter with a narrower filter of similar size...."

>RadioShack is selling the Pro-91 trunktracker for $179.99 if you have the

>coupon from their flyer. They are also giving another 10% off

Bought one today. Wonder if it would not have been better to have bought the Pro-90 instead, since all those trunk numbers really use up the banks. Does anyone have both the '90 and the '91 and wish to explain the comparative differences? Since the frequency ranges are slightly different, it would appear that they have different processors. Prefer the battery arrangement in the '91.

Scotty

6075. Direction Finding Antenna???

Newsgroup: rec.radio.scanner
Date: 1998-05-31 00:00:00 UTC
From: clarkm@pacbell.net
Message-ID: <clarkm-3105980023320001@129.0.0.222>
Source record: 158943

I've recently bought a scanner and thought it might be interesting to do direction finding using it. I expect such an antenna would be fairly narrow band, but that's okay. Does anyone know how to build such a thing or know where to find plans to do so?

6076. Still trying to find key beep disable mod for RS Pro-39

Newsgroup: rec.radio.scanner
Date: 1998-05-31 00:00:00 UTC
From: mtbikerno@spamnojps.net
Message-ID: <35721243.4918715@news.jps.net>
Source record: 158944
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I posted a message about two weeks ago asking if anyone knew how to disable the beep on a Radio Shack Pro-39 and 2040. Somebody posted a reply telling me how to do it for most scanners (check the pins coming off the CPU with a DVM and find the one going to the audio amp that shows an increase in voltage when a key is pressed). I was able to complete the beep disable mods for my 2040, 2022, and 2024 this way. But when I took my Pro-39 apart I wasn't able to check the pins on its CPU because when the second of the 3 circuit boards is removed, two connectors (CN3, 11 pins, and one other with 2 pins) are separated and I don't know of any safe way to temporarily connect them so the scanner will operate. So if anyone out there knows exactly what I need to cut or remove to disable the beep, please post a reply. I have checked for this information on the Internet and on alt.radio.scanner and rec.radio.scanner using DejaNews but have been unable to find it. Thanks in advance.

I have a Radio Shack Pro-43 for sale.

This scanner comes with the manual, box, power supply and batterys. The case is in great shape. The unit is about 4 1/2 years old and the unit does work great. It has just been sent in to have the number pad replaced because some of the buttons did not work. And it was checked over. The unit can be mod, which it has not been done.

I am asking $225.00 which includes the shipping charge.

Some other alternatives are the PRO2042 on sales for $299 (perhaps less) and
the BC895XLT for about $250-$275.

I don't know if the original poster thinks that is reasonably priced or not but
they are good scanners for the money. The 2042 has a lot of flexibility; the
BC895 has both great sensitivity and trunk tracking.

6093. BC220 Help?

Newsgroup: rec.radio.scanner
Date: 1998-05-31 00:00:00 UTC
From: John Black <jmblack@compuserve.com>
Message-ID: <357180CC.4B4E6583@compuserve.com>
Source record: 159011

Hello everyone. I've just picked up a Bearcat 220 scanner, and am looking for some service info for it. If anyone has a schematic they wouldn't mind copying, I'd be glad to pay expenses.

The scanner works great after about 15 minutes of play. Before that, the squelch either stays open all the time, or is so tight that nothing will get through. I've read the FAQ on these scanners and have been over the soldering joints, etc. Some components really run hot in this set!

Thanks for any help!

Probably not more than a couple of miles of course with the exception of
transmissions from a plane, in air, within line of sight. You should
consider some sort of gain antenna.

I bought 3 of them for $129.95. If you look at the two sockets where
the CTCSS board plugs in, one of the two sockets has 3 pins. The
middle pin of the three pin socket has discriminator audio
feeding the input of the CTCSS board. Just plug a wire
into that pin for a "no solder" mod for discriminator audio out.
I have three of these radios on in front of me now. With the CTCSS
boards in use, they are very quite, no intermod or other unwanted
signals. At this price for basic monitoring, I would grab them.

No, 155.505 is rarely scrambled. It is used for interagency coordination and since all the agencies do not have the capability to use scrambling I often hear operations in the clear. A few months ago I heard Customs, FBI, DPS, and several local departments (probably a narcotics task force) use this frequency. A customs jet was following a small aircraft that was suspected of transporting drugs. The pilots and officers on the ground were coordinating operations at Montgomery Co. Airport and Hooks Airport since they didn't know which airport the plane might choose to land at. I could also hear officers running license plate checks on several cars parked at Montgomery Co. Airport that might be involved in picking up the drugs. The plane finally landed at Hooks Airport and the drug runners taken into custody.

6114. Programming the 64/2041 w/ Excel

Newsgroup: rec.radio.scanner
Date: 1998-05-31 00:00:00 UTC
From: cdeviney@ipa.net
Message-ID: <3571ba8d.26291370@news2.ipa.net>
Source record: 159032

Just FYI-

64-2041.XLS is an excel template which can be used as a frequency manager and it also can be used to program all 400 channels of the PRO-64 and PRO-2041 in just over one minute by hitting CTRL-s (send). It is available at Ken Plotkin's web site:

http://www.access.digex.net/~kplotkin/scanner.htm

The Excel frequency manager has been updated to include:

* Duplicate Frequency Elimination (thanks to Jim Nichols)-
I was using ScannerBase frequency CD to search for all the police and highway patrol in Arkansas, and came up with over 1800 hits, many of which were duplicate frequencies, used county to county. This feature eliminates all dups and got the number of frequencies down to just over 400.

* Data Validation (thanks to Jack O'Connell)-
If you accidentally try to program the PRO-64 or PRO-2041 with a frequency that the scanner cannot accept (does not cover) you get an ERROR message, and programming stops. This can be very frustrating when trying to figure out why the scanner won't FINISH programming.

* Go To Bank# -
Macros will take you to the first channel of each bank:
CTRL-a = Bank# 1 CTRL-b = Bank# 2 etc.

* How to Program Your Scanner Using a Sharp Zaurus PDA -
Using the 64-2041.PRN file or the FRDUMP.TXT file from Ken's LOAD program; connect the serial port on the Zaurus to the earphone port on the scanner, go to "terminal mode" on the PDA, LogOn, Upload Text (ASCII)....
Makes for a very portable, compact, economical setup - a good bit cheaper and lighter than a notebook computer on trips. These PDAs are currently available for $59-$79 at:
http://www.onsale.com
Electronics
PDAs & Organizers
I would like to hear from anyone that is using another PDA/palmtop/handheld with the 64/2041 or another scanner.

The "instructions" that come with the Excel template also explain how to build a cable for less than $8 with parts from Radio Shack (if I can do it, ANYONE can...no soldering required).

The "instructions" includes the 6-battery pack mod so that you can recharge your batteries inside the scanner.

Many thanks to Ken Plotkin for his great 64/2041 website. There are several programs there for uploading frequencies to these two scanners. His LOAD and LOAD64 are written in Fortran but run on DOS, and Robert Miller's WLOAD64 runs on Win95.

These two scanners are currently on clearance sale at Radio Shack, down from the original $300 to $150 (if you can find one) and the $20 leather case is down from $20 to $3.

Barry,

This segment of the band is primarily used for control links... most of which is paging. All that digital stuff you hear is paging traffic. There still is some voice control links where you may hear remote hilltop receivers dumping out their audio on this band, but for the most part, voice links are going microwave and other routes.

> Thanks
Paul and Jacki,

Even with your rubber ducky you should be able to recieve the aircraft side on VHF (116-136 MHz). At 50 miles, I think you would need a real good antenna to get the ground side on VHF.

You can pick up a fair amount of military aircraft but mostlt on HF (i.e. shortwave frequencies). You can also pick up commercial airliners on these freqs. Military aircraft also use the 220-380 MHz band. Not too many scanners out there that cover this range, but if you are willing to pay a few hundred bucks you can find some.

Hope this helps...

Can you explain what this optional board will do for my 2045? Did you say it
will make it quieter?

A BIT OF FIDDLING SOON SORTS THINGS OUT

OK ensure the audio come from the scanner from external speaker socket
and instead of input via line in try input via mic in on the sound card
also make sure the windows 95 s card option are at CD quality

6132. ICOM R10 -- computer capabilities

Newsgroup: rec.radio.scanner
Date: 1998-05-31 00:00:00 UTC
From: caj@urth.autarch.com
Message-ID: <6ksn5o$3a6@urth.autarch.com>
Source record: 159050

I've consulted dejanews, but I'm still not quite clear on the computer capabilities of this scanner.

I assume this scanner is computer controllable to at least the extent it is manually controllable? Moreso? Less so?

Is programming information available? I'd want to write my own software. (I run FreeBSD.)

Will it scan faster under computer control? The manual scan rate is pretty slow.

Under computer control, could one bypass the annoying mandatory 2-second delay after reception?

Thanks for any info or pointers.
-Craig

6133. List of the rec.radio newsgroups

Newsgroup: rec.radio.scanner
Date: 1998-05-31 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6kqqih$igu@news.Hawaii.Edu>
Source record: 159051
Cross-posted to: rec.radio.info,rec.radio.swap,rec.radio.scanner

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman (KH2PZ / KH6)
(rec.radio.amateur working-group)

Is there and places on the net located in canada that sell the MVT-7100
or 7200
Id rather give my money to canada than the UK..... (no offence intended
but it would be faster since im located in upstate NY)
thanks in advance.

John Habbinga wrote in message <6ks7h7qth1@news4.wt.net>...
>No, 155.505 is rarely scrambled.

John it may not be NOW but in the early 90's it was for sure.I have friends that were and are still in enforcement in and around the gulf coast,and they did use that freq. and it was "secure" at that time.In fact there were unpublished channels they were using and were also "secure".

>It is used for interagency coordination and
>since all the agencies do not have the capability to use scrambling I often
>hear operations in the clear.

I do not know where you got this.Admitted it maybe use for that now,but then it was not.
Also if you will dig a little,you will find that many local S/O narcotics have the capability to go to code.If I am using the wrong terms here forgive me,I am not perfect.I do remember many times asking for info on this stuff then,the officers only knew that it was coded and they did not know from day to day which codes they would be.

>A few months ago I heard Customs, FBI, DPS,
>and several local departments (probably a narcotics task force) use this

>custody.

It is not hard to pick out the local or S/O,or what ever units happen to be running the sting.I would give you a list of local PD,S/O and other unit numbers,but I am sure they have changed since the systems have.Have a good one,Nomad
